1 Primitive Notions

Let there be *sets*.

Let there be a binary relation called *membership*, \in . When $x \in y$ holds, we say x is a *member* or *element* of y . We write $x \notin y$ iff x is not a member of y .

2 The Axioms

Axiom 1 (Extensionality). *If two sets have exactly the same members, then they are equal.*

As a consequence of this axiom, we may identify a set A with the class $\{x : x \in A\}$. The use of the symbols \in and $=$ is consistent.

Definition 2. We say that a class \mathbf{A} is a *set* iff there exists a set A such that $A = \mathbf{A}$. That is, the class $\{x : P(x)\}$ is a set iff

$$\exists A. \forall x (x \in A \leftrightarrow P(x)) .$$

Otherwise, \mathbf{A} is a *proper class*.

Definition 3 (Subset). If A is a set and \mathbf{B} is a class, we say A is a *subset* of \mathbf{B} iff $A \subseteq \mathbf{B}$.

Axiom 4 (Empty Set). *The empty class is a set, called the empty set.*

Axiom 5 (Pairing). *For any objects a and b , the class $\{a, b\}$ is a set, called a pair set.*

Definition 6 (Union). For any class of sets \mathbf{A} , the *union* $\bigcup \mathbf{A}$ is the class $\{x : \exists A \in \mathbf{A}. x \in A\}$.

We write $\bigcup_{P[x_1, \dots, x_n]} t[x_1, \dots, x_n]$ for $\bigcup \{t[x_1, \dots, x_n] : P[x_1, \dots, x_n]\}$.

Proposition 7. *If $\mathbf{A} \subseteq \mathbf{B}$ then $\bigcup \mathbf{A} \subseteq \bigcup \mathbf{B}$.*

PROOF: Easy. \square

Axiom 8 (Union). *For any set A , the union $\bigcup A$ is a set.*

Proposition 9. *For any sets A and B , the class $A \cup B$ is a set.*

PROOF: It is $\bigcup\{A, B\}$. \square

Proposition Schema 10. *For any objects a_1, \dots, a_n , the class $\{a_1, \dots, a_n\}$ is a set.*

PROOF: By repeated application of the Pairing and Union axioms. \square

Definition 11 (Power Set). For any set A , the *power set* of A , $\mathcal{P}A$, is the class of all subsets of A .

Axiom 12 (Power Set). *For any set A , the class $\mathcal{P}A$ is a set.*

Axiom 13 (Subset, Aussonderung). *For any class \mathbf{A} and set B , if $\mathbf{A} \subseteq B$ then \mathbf{A} is a set.*

Proposition 14. *For any set A and class \mathbf{B} , the intersection $A \cap \mathbf{B}$ is a set.*

PROOF: By the Subset Axiom since it is a subclass of A . \square

Proposition 15. *For any set A and class \mathbf{B} , the relative complement $A - \mathbf{B}$ is a set.*

PROOF: By the Subset Axiom since it is a subclass of A . \square

PROOF: By the Subset Axiom.

$\langle 1 \rangle 4$. $R \in R$ if and only if $R \notin R$

$\langle 1 \rangle 5$. Q.E.D.

PROOF: This is a contradiction.

\square

Definition 17 (Intersection). For any class of sets \mathbf{A} , the *intersection* $\bigcap \mathbf{A}$ is the class $\{x : \forall A \in \mathbf{A}. x \in A\}$.

We write $\bigcap_{P[x_1, \dots, x_n]} t[x_1, \dots, x_n]$ for $\bigcap \{t[x_1, \dots, x_n] : P[x_1, \dots, x_n]\}$.

Definition 77 (Strict Partial Order). A *strict partial order* is an irreflexive, transitive relation.

If $<$ is a strict partial order, we write $x \leq y$ for $x < y \vee x = y$.

Theorem 78. Assume that $<$ is a partial order. Then for any x, y and z :

1. At most one of the three alternatives,

$$x < y, x = y, y < x,$$

can hold.

2. $x \leq y \leq x \Rightarrow x = y$.

PROOF: Easy. □

Definition 79 (Minimal). Let $<$ be a partial order on D . An element $m \in D$ is *minimal* iff there is no $x \in D$ such that $x < m$.

Definition 80 (Maximal). Let $<$ be a partial order on D . An element $m \in D$ is *maximal* iff there is no $x \in D$ such that $m < x$.

Definition 81 (Least). Let $<$ be a partial order on D . An element $m \in D$ is *least*, *smallest* or the *minimum* iff $\forall x \in D. m \leq x$.

Definition 82 (Greatest). Let $<$ be a partial order on D . An element $m \in D$ is *greatest*, *largest* or the *maximum* iff $\forall x \in D. x \leq m$.

Proposition 83. If R is a partial ordering on D then so is R^{-1} .

PROOF: Easy. □

Definition 84 (Upper Bound). Let $<$ be a partial order on A and $C \subseteq A$. An *upper bound* for C is an element $b \in A$ such that $\forall x \in C. x \leq b$.

12 Linear Orders

Definition 86 (Linear Ordering). Let \mathbf{A} be a class. A *linear ordering* or *total ordering* on \mathbf{A} is a relation \mathbf{R} on \mathbf{A} such that:

- \mathbf{R} is transitive.
- \mathbf{R} satisfies *trichotomy* on \mathbf{A} ; i.e. for any $x, y \in \mathbf{A}$, exactly one of

$$x\mathbf{R}y, x = y, y\mathbf{R}x$$

holds.

Theorem 87. Let \mathbf{R} be a linear ordering on \mathbf{A} .

1. There is no x such that $x\mathbf{R}x$.
2. For distinct x and y in \mathbf{A} , either $x\mathbf{R}y$ or $y\mathbf{R}x$.

PROOF: Immediate from trichotomy. \square

Definition 88 (Strictly Monotone Functions). Let A and B be linearly ordered sets. A function $f : A \rightarrow B$ is *strictly monotone* iff, for all $x, y \in A$, if $x < y$ then $f(x) < f(y)$.

Theorem 89. Let A and B be linearly ordered sets and $f : A \rightarrow B$ be strictly monotone. For all $x, y \in A$, if $f(x) < f(y)$ then $x < y$.

PROOF: We have $f(x) \neq f(y)$ and $f(y) \not< f(x)$ by trichotomy, hence $x \neq y$ and $y \not< x$ since f is strictly monotone, hence $x < y$ by trichotomy. \square

Theorem 90. Every strictly monotone function is injective.

PROOF: If $f(x) = f(y)$, then we have $f(x) \not< f(y)$ and $f(y) \not< f(x)$ by trichotomy, hence $x \not< y$ and $y \not< x$ since f is strictly monotone, hence $x = y$ by trichotomy. \square

13 Natural Numbers
