1 Primitive Notions

Let there be *sets*.

Let there be a binary relation called *membership*, \in . When $x \in y$ holds, we say x is a *member* or *element* of y . We write $x \notin y$ iff x is not a member of y .

2 The Axioms

Axiom 1 (Extensionality). *If two sets have exactly the same members, then they are equal.*

As a consequence of this axiom, we may identify a set A with the class $\{x : x \in A\}$. The use of the symbols \in and $=$ is consistent.

Definition 2. We say that a class \mathbf{A} *is a set* iff there exists a set A such that $A = \mathbf{A}$. That is, the class $\{x : P(x)\}$ is a set iff

$$\exists A. \forall x (x \in A \leftrightarrow P(x)) .$$

Otherwise, \mathbf{A} is a *proper class*.

Definition 3 (Subset). If A is a set and \mathbf{B} is a class, we say A is a *subset* of \mathbf{B} iff $A \subseteq \mathbf{B}$.

Definition 4 (Power Set). For any set A , the *power set* of A , $\mathcal{P}A$, is the class of all subsets of A .
