C1 Set Theory

Robin Adams

September 7, 2022

1 Primitive Notions

Let there be *sets*.

Let there be a binary relation called *membership*, $\in$. When $x \in y$ holds, we say x is a *member* or *element* of y. We write $x \notin y$ iff x is not a member of y.

Definition 1 (Transitive Set). A set A is a *transitive set* iff every member of a member of A is a member of A.

2 The Axioms

Axiom 2 (Extensionality). *If two sets have exactly the same members, then they are equal.*

As a consequence of this axiom, we may identify a set A with the class $\{x : x \in A\}$. The use of the symbols $\in$ and $=$ is consistent.

Definition 3. We say that a class $\mathbf{A}$ *is a set* iff there exists a set A such that $A = \mathbf{A}$. That is, the class $\{x : P(x)\}$ is a set iff

$$\exists A. \forall x (x \in A \leftrightarrow P(x)) \ .$$

Otherwise, $\mathbf{A}$ is a *proper class*.

Definition 4 (Subset). If A is a set and $\mathbf{B}$ is a class, we say A is a *subset* of $\mathbf{B}$ iff $A \subseteq \mathbf{B}$.

Axiom 5 (Empty Set). *The empty class is a set, called the* empty set*.*

Axiom 6 (Replacement). *For any property $P(x, y)$, the following is an axiom:*
Let A be a set. Assume that, for all $x \in A$, there is at most one y such that $P(x, y)$. Then $\{y : \exists x \in A. P(x, y)\}$ is a set.

Definition 7 (Power Set). For any set A, the *power set* of A, $\mathcal{P}A$, is the class of all subsets of A.

Axiom 8 (Power Set). *For any set A, the class $\mathcal{P}A$ is a set.*

Theorem 9 (Pairing)**.** *For any objects a and b, the class $\{a, b\}$ is a set, called a pair set.*

PROOF: Let a and b be sets. Let $P(x, y)$ be the formula $(x = \emptyset \ \& \ y = a)$ or $(x = \mathcal{P}\emptyset \ \& \ y = b)$. Then we have $(\forall x \in \mathcal{P}\mathcal{P}\emptyset)\forall y_1 \forall y_2(P(x, y_1) \ \& \ P(x, y_2) \Rightarrow y_1 = y_2)$, hence there exists a set c such that
$$\forall y(y \in c \Leftrightarrow (\exists x \in \mathcal{P}\mathcal{P}\emptyset)P(x, y))$$
The members of c are just a and b. □

Definition 10 (Union)**.** For any class of sets $\mathbf{A}$, the *union* $\bigcup \mathbf{A}$ is the class $\{x : \exists A \in \mathbf{A}.x \in A\}$.
  We write $\bigcup_{P[x_1,\ldots,x_n]} t[x_1, \ldots, x_n]$ for $\bigcup\{t[x_1, \ldots, x_n] : P[x_1, \ldots, x_n]\}$.

Proposition 11. *If $\mathbf{A} \subseteq \mathbf{B}$ then $\bigcup \mathbf{A} \subseteq \bigcup \mathbf{B}$.*

PROOF: Easy. □

Axiom 12 (Union)**.** *For any set A, the union $\bigcup A$ is a set.*

Proposition 13. *For any sets A and B, the class $A \cup B$ is a set.*

PROOF: It is $\bigcup\{A, B\}$. □

Proposition Schema 14. *For any objects a_1, ..., a_n, the class $\{a_1, \ldots, a_n\}$ is a set.*

PROOF: By repeated application of the Pairing and Union axioms. □

Theorem 15 (Subset Axioms, Aussonderung)**.** *For any class $\mathbf{A}$ and set B, if $\mathbf{A} \subseteq B$ then $\mathbf{A}$ is a set.*

PROOF: Let $Q(x, y)$ be the formula $x \in \mathbf{A} \wedge y = x$. Now we reason as follows. Let c be any set. Then we have
$$(\forall x \in B)\forall y_1 \forall y_2(Q(x, y_1) \ \& \ Q(x, y_2) \Rightarrow y_1 = y_2)$$
Then, by a Replacement Axiom, there exists a set c such that
$$\forall y(y \in c \Leftrightarrow (\exists x \in B)Q(x, y)) \ .$$
This is equivalent to $\forall x(x \in c \Leftrightarrow x \in \mathbf{A})$. □

Proposition 16. *For any set A and class $\mathbf{B}$, the intersection $A \cap \mathbf{B}$ is a set.*

PROOF: By the Subset Axiom since it is a subclass of A. □

Proposition 17. *For any set A and class $\mathbf{B}$, the relative complement $A - \mathbf{B}$ is a set.*

PROOF: By the Subset Axiom since it is a subclass of A. □

Theorem 18. *The universal class $\mathbf{V}$ is a proper class.*

PROOF:
$\langle 1 \rangle 1$. ASSUME: $\mathbf{V}$ is a set.
$\langle 1 \rangle 2$. LET: $R = \{x : x \notin x\}$

⟨1⟩3. R is a set.

    PROOF: By the Subset Axiom.

⟨1⟩4. $R \in R$ if and only if $R \notin R$

⟨1⟩5. Q.E.D.

    PROOF: This is a contradiction.

☐

Definition 19 (Intersection)**.** For any class of sets $\mathbf{A}$, the *intersection* $\bigcap \mathbf{A}$ is the class $\{x : \forall A \in \mathbf{A}.x \in A\}$.

    We write $\bigcap_{P[x_1,\ldots,x_n]} t[x_1,\ldots,x_n]$ for $\bigcap\{t[x_1,\ldots,x_n] : P[x_1,\ldots,x_n]\}$.

Proposition 20. *For any nonempty class of sets* $\mathbf{A}$, *the class* $\bigcap \mathbf{A}$ *is a set.*

PROOF: Pick $A \in \mathbf{A}$. Then $\bigcap \mathbf{A} \subseteq A$. ☐

Proposition 21. *If* $\mathbf{A} \subseteq \mathbf{B}$ *then* $\bigcap \mathbf{B} \subseteq \bigcap \mathbf{A}$.

PROOF: Easy. ☐

Proposition 22. *For any set* A *and class of sets* $\mathbf{B}$, *we have*

$$A \cup \bigcap \mathbf{B} = \bigcap\{A \cup X \mid X \in \mathbf{B}\}$$

PROOF: Easy. ☐

Proposition 23. *For any set* A *and class of sets* $\mathbf{B}$, *we have*

$$A \cap \bigcup \mathbf{B} = \bigcup\{A \cap X \mid X \in \mathbf{B}\}$$

PROOF: Easy. ☐

Proposition 24. *For any set* C *and class of sets* $\mathbf{A}$, *we have*

$$C - \bigcup \mathbf{A} = \bigcap\{C - X \mid X \in \mathbf{A}\} \ .$$

PROOF: Easy. ☐

Proposition 25. *For any set* C *and class of sets* $\mathbf{A}$, *we have*

$$C - \bigcap \mathbf{A} = \bigcup\{C - X \mid X \in \mathbf{A}\} \ .$$

PROOF: Easy. ☐

Axiom 26 (Regularity)**.** *For every nonempty set* A, *there exists* $m \in A$ *such that* $m \cap A = \emptyset$.

Theorem 27. *No set is a member of itself.*

PROOF: If $A \in A$ then there is no $m \in \{A\}$ such that $m \cap \{A\} = \emptyset$. ☐

Theorem 28. *There are no sets* a *and* b *with* $a \in b$ *and* $b \in a$.

PROOF: If there were, then there would be no $m \in \{a, b\}$ such that $m \cap \{a, b\} = \emptyset$.
☐

3 Ordered Pairs

Definition 29 (Ordered Pair)**.** For any objects a and b, the *ordered pair* (a, b) is $\{\{a\}, \{a, b\}\}$. We call a its *first coordinate* and b its *second coordinate*.

Theorem 30. *For any objects (a, b), we have $(a, b) = (c, d)$ if and only if $a = c$ and $b = d$.*

PROOF:
$\langle 1 \rangle 1$. If $(a, b) = (c, d)$ then $a = c$ and $b = d$
  $\langle 2 \rangle 1$. ASSUME: $(a, b) = (c, d)$
  $\langle 2 \rangle 2$. $a = c$
    PROOF: Since $\{a\} = \bigcap (a, b) = \bigcap (c, d) = \{c\}$.
  $\langle 2 \rangle 3$. $\{a, b\} = \{c, d\}$
    PROOF: $\{a, b\} = \bigcup (a, b) = \bigcup (c, d) = \{c, d\}$.
  $\langle 2 \rangle 4$. $b = c$ or $b = d$
  $\langle 2 \rangle 5$. CASE: $b = c$
    $\langle 3 \rangle 1$. $a = b$
    $\langle 3 \rangle 2$. $\{c, d\} = \{a\}$
    $\langle 3 \rangle 3$. $b = d$
  $\langle 2 \rangle 6$. CASE: $b = d$
    PROOF: We have $a = c$ and $b = d$ as required.
$\langle 1 \rangle 2$. If $a = c$ and $b = d$ then $(a, b) = (c, d)$
  PROOF: Trivial.
☐

Definition 31 (Cartesian Product)**.** The *Cartesian product* of classes $\mathbf{A}$ and $\mathbf{B}$ is the class
$$\mathbf{A} \times \mathbf{B} = \{(x, y) : x \in \mathbf{A}, y \in \mathbf{B}\} \ .$$

Lemma 32. *For any objects x and y and set C, if $x \in C$ and $y \in C$ then $(x, y) \in \mathcal{PP}C$.*

PROOF: Easy. ☐

Corollary 32.1. *For any sets A and B, the Cartesian product $A \times B$ is a set.*

PROOF: By the Subset Axiom applied to $\mathcal{PP}(A \cup B)$. ☐

Lemma 33. *If $(x, y) \in \mathbf{A}$ then $x, y \in \bigcup \bigcup \mathbf{A}$.*

PROOF: Easy. ☐

4 Relations

Definition 34 (Relation)**.** A *relation* is a class of ordered pairs. It is *small* iff it is a set.
    When $\mathbf{R}$ is a relation, we write $x \mathbf{R} y$ for $(x, y) \in \mathbf{R}$.

Definition 35 (Domain)**.** The *domain* of a class $\mathbf{R}$ is $\operatorname{dom}\mathbf{R} = \{x : \exists y.(x, y) \in \mathbf{R}\}$.

Definition 36 (Range)**.** The *range* of a class $\mathbf{R}$ is $\operatorname{ran}\mathbf{R} = \{y : \exists x.(x, y) \in \mathbf{R}\}$.

Definition 37 (Field)**.** The *field* of a class $\mathbf{R}$ is $\operatorname{fld}\mathbf{R} = \operatorname{dom}\mathbf{R} \cup \operatorname{ran}\mathbf{R}$.

Proposition 38. *If R is a set then $\operatorname{dom}R$, $\operatorname{ran}R$ and $\operatorname{fld}R$ are sets.*

PROOF: Apply the Subset Axiom to $\bigcup\bigcup R$. $\square$

Definition 39 (Single-Rooted)**.** A class $\mathbf{R}$ is *single-rooted* iff, for all $y \in \operatorname{ran}\mathbf{R}$, there is only one x such that $x\mathbf{R}y$.

Definition 40 (Inverse)**.** The *inverse* of a class $\mathbf{F}$ is the class $\mathbf{F}^{-1} = \{(y, x) \mid (x, y) \in \mathbf{F}\}$.

Theorem 41. *For any class $\mathbf{F}$, we have $\operatorname{dom}\mathbf{F}^{-1} = \operatorname{ran}\mathbf{F}$ and $\operatorname{ran}\mathbf{F}^{-1} = \operatorname{dom}\mathbf{F}$.*

PROOF: Easy. $\square$

Theorem 42. *For a relation $\mathbf{F}$, $(\mathbf{F}^{-1})^{-1} = \mathbf{F}$.*

PROOF: Easy. $\square$

Definition 43 (Composition)**.** The *composition* of classes $\mathbf{F}$ and $\mathbf{G}$ is the class $\mathbf{G} \circ \mathbf{F} = \{(x, z) \mid \exists y.(x, y) \in \mathbf{F} \wedge (y, z) \in \mathbf{G}\}$.

Theorem 44. *For any classes $\mathbf{F}$ and $\mathbf{G}$, $(\mathbf{F} \circ \mathbf{G})^{-1} = \mathbf{G}^{-1} \circ \mathbf{F}^{-1}$.*

PROOF: Easy. $\square$

Definition 45 (Restriction)**.** The *restriction* of the class $\mathbf{F}$ to the class $\mathbf{A}$ is the class $\mathbf{F} \restriction \mathbf{A} = \{(x, y) : x \in A \wedge (x, y) \in \mathbf{F}\}$.

Definition 46 (Image)**.** The *image* of the class $\mathbf{A}$ under the class $\mathbf{F}$ is the class $\mathbf{F}(\mathbf{A}) = \{y : \exists x \in \mathbf{A}.(x, y) \in \mathbf{F}\}$.

Theorem 47.
$$\mathbf{F}(\mathbf{A} \cup \mathbf{B}) = \mathbf{F}(\mathbf{A}) \cup \mathbf{F}(\mathbf{B})$$

PROOF: Easy. $\square$

Theorem 48.
$$\mathbf{F}(\bigcup \mathbf{A}) = \bigcup \{\mathbf{F}(X) : X \in \mathbf{A}\}$$

PROOF: Easy. $\square$

Theorem 49.
$$\mathbf{F}(\mathbf{A} \cap \mathbf{B}) \subseteq \mathbf{F}(\mathbf{A}) \cap \mathbf{F}(\mathbf{B})$$

Equality holds if $\mathbf{F}$ is single-rooted.

PROOF: Easy. □

Theorem 50.
$$\mathbf{F}(\bigcap \mathbf{A}) \subseteq \bigcap \{\mathbf{F}(X) : X \in \mathbf{A}\}$$

Equality holds if **F** *is single-rooted.*

PROOF: Easy. □

Theorem 51.
$$\mathbf{F}(\mathbf{A}) - \mathbf{F}(\mathbf{B}) \subseteq \mathbf{F}(\mathbf{A} - \mathbf{B})$$

Equality holds if **F** *is single-rooted.*

PROOF: Easy. □

Definition 52 (Reflexive)**.** A binary relation **R** on **A** is *reflexive* on **A** if and only if $\forall x \in \mathbf{A}.x\mathbf{R}x$.

Definition 53 (Symmetric)**.** A binary relation **R** is *symmetric* iff, whenever $x\mathbf{R}y$, then $y\mathbf{R}x$.

Definition 54 (Transitive)**.** A binary relation **R** is *transitive* iff, whenever $x\mathbf{R}y$ and $y\mathbf{R}z$, then $x\mathbf{R}z$.

Definition 55 (Minimal)**.** Let R be a relation on D. An element $m \in D$ is *R-minimal* iff there is no $x \in D$ such that $x < m$.

5 n-ary Relations

Definition 56. Given objects a, b, c, define the *ordered triple* (a, b, c) to be $((a, b), c)$.
  Define $(a, b, c, d) = ((a, b, c), d)$, etc.
  Define the *1-tuple* (a) to be a.

Definition 57 (n-ary Relation)**.** Given a class **A**, an *n-ary relation* on **A** is a class of ordered n-tuples, all of whose components are in **A**.

6   Functions

Definition 58 (Function)**.** A *function* is a relation **F** such that, for all $x \in \operatorname{dom} \mathbf{F}$, there is only one y such that $x\mathbf{F}y$. We call this unique y the *value* of **F** at x and denote it by $\mathbf{F}(x)$.
  We say **F** is a function *from* **A** *into* **B**, or **F** *maps* **A** into **B**, and write $\mathbf{F} : \mathbf{A} \to \mathbf{B}$, iff **F** is a function, $\operatorname{dom} \mathbf{F} = \mathbf{A}$, and $\operatorname{ran} \mathbf{F} \subseteq \mathbf{B}$.
  If, in addition, $\operatorname{ran} \mathbf{F} = \mathbf{B}$, we say **F** is a function from **A** *onto* **B**.

Theorem 59. *For a class* **F**, $\mathbf{F}^{-1}$ *is a function if and only if* **F** *is single-rooted.*

PROOF: Easy. □

Theorem 60. *A relation* $\mathbf{F}$ *is a function if and only if* $\mathbf{F}^{-1}$ *is single-rooted.*

PROOF: Easy. $\square$

Theorem 61. *For any function* $\mathbf{G}$ *and classes* $\mathbf{A}$ *and* $\mathbf{B}$,

$$\mathbf{G}^{-1}(\bigcup \mathbf{A}) = \bigcup \{\mathbf{G}^{-1}(X) : X \in \mathbf{A}\}$$

$$\mathbf{G}^{-1}(\bigcap \mathbf{A}) = \bigcap \{\mathbf{G}^{-1}(X) : X \in \mathbf{A}\} \qquad (\textit{if } \mathbf{A} \neq \emptyset)$$

$$\mathbf{G}^{-1}(\mathbf{A} - \mathbf{B}) = \mathbf{G}^{-1}(\mathbf{A}) - \mathbf{G}^{-1}(\mathbf{B})$$

PROOF: Easy. $\square$

Theorem 62. *Assume that* $\mathbf{F}$ *and* $\mathbf{G}$ *are functions. Then* $\mathbf{F} \circ \mathbf{G}$ *is a function, its domain is* $\{x \in \operatorname{dom} \mathbf{G} : \mathbf{G}(x) \in \operatorname{dom} \mathbf{F}\}$, *and for* x *in its domain,*

$$(\mathbf{F} \circ \mathbf{G})(x) = \mathbf{F}(\mathbf{G}(x)) \ .$$

PROOF: Easy. $\square$

Definition 63 (One-to-one). A function $\mathbf{F}$ is *one-to-one* or an *injection* iff it is single-rooted.

Theorem 64. *Let* $\mathbf{F}$ *be a one-to-one function. For* $x \in \operatorname{dom} \mathbf{F}$, $\mathbf{F}^{-1}(\mathbf{F}(x)) = x$.

PROOF: Easy. $\square$

Theorem 65. *Let* $\mathbf{F}$ *be a one-to-one function. For* $y \in \operatorname{ran} \mathbf{F}$, $\mathbf{F}(\mathbf{F}^{-1}(y)) = y$.

PROOF: Easy. $\square$

Definition 66 (Identity Function). For any class $\mathbf{A}$, the *identity* function on $\mathbf{A}$ is $\operatorname{id}_{\mathbf{A}} = \{(x, x) \mid x \in \mathbf{A}\}$.

Theorem 67. *Let* $F : A \to B$. *Assume* $A \neq \emptyset$. *Then* F *has a left inverse (i.e. there exists* $G : B \to A$ *such that* $G \circ F = \operatorname{id}_A$) *if and only if* F *is one-to-one.*

PROOF:

$\langle 1 \rangle$1. If F is one-to-one then F has a left inverse.

 $\langle 2 \rangle$1. ASSUME: F is one-to-one.

 $\langle 2 \rangle$2. $F^{-1} : \operatorname{ran} F \to A$

 $\langle 2 \rangle$3. PICK $a \in A$

 $\langle 2 \rangle$4. Define $G : B \to A$ by:

$$G(x) = \begin{cases} F^{-1}(x) & \text{if } x \in \operatorname{ran} F \\ a & \text{if } x \in B - \operatorname{ran} F \end{cases}$$

 $\langle 2 \rangle$5. $\forall x \in A.G(F(x)) = x$

$\langle 1 \rangle$2. If F has a left inverse then F is one-to-one.

 $\langle 2 \rangle$1. ASSUME: F has a left inverse G.

 $\langle 2 \rangle$2. LET: $x, y \in A$ with $F(x) = F(y)$

 $\langle 2 \rangle$3. $x = y$

  PROOF: $x = G(F(x)) = G(F(y)) = y$.

$\square$

Definition 68 (Binary Operation). A *binary operation* on a set A is a function from $A \times A$ into A.

7 The Axiom of Choice

Axiom 69 (Choice). *For any relation R there exists a function $H \subseteq R$ with $\operatorname{dom} H = \operatorname{dom} R$.*

Theorem 70. *Let $F : A \to B$. Then F has a right inverse if and only if F maps A onto B.*

PROOF:
$\langle 1 \rangle 1$. If F has a right inverse then F maps A onto B.
   PROOF: If $H : B \to A$ is a right inverse, then for any y in B, we have $y = F(H(y))$.
$\langle 1 \rangle 2$. If F maps A onto B then F has a right inverse.
   $\langle 2 \rangle 1$. ASSUME: F maps A onto B.
   $\langle 2 \rangle 2$. PICK a function H with $H \subseteq F^{-1}$ and $\operatorname{dom} H = \operatorname{dom} F^{-1}$
     PROOF: By the Axiom of Choice.
   $\langle 2 \rangle 3$. $\operatorname{dom} H = B$
     PROOF: $\operatorname{dom} H = \operatorname{dom} F^{-1} = \operatorname{ran} F = B$ by $\langle 2 \rangle 1$.
   $\langle 2 \rangle 4$. For all $y \in B$ we have $F(H(y)) = y$
     $\langle 3 \rangle 1$. LET: $y \in B$
     $\langle 3 \rangle 2$. $(y, H(y)) \in F^{-1}$
     $\langle 3 \rangle 3$. $F(H(y)) = y$
$\square$

8 Sets of Functions

Definition 71. Let A be a set and $\mathbf{B}$ be a class. Then $\mathbf{B}^A$ is the class of all functions $A \to \mathbf{B}$.

9 Dependent Products

Definition 72. Let I be a set and H_i a set for all $i \in I$. Define

$$\prod_{i \in I} H_i = \{ f : f \text{ is a function}, \operatorname{dom} f = I, \forall i \in I. f(i) \in H_i \} \ .$$

Theorem 73. *The Axiom of Choice is equivalent to the statement: For any set I and any function H with domain I, if $H(i) \neq \emptyset$ for all $i \in I$, then $\prod_{i \in I} H(i) \neq \emptyset$*

PROOF:
$\langle 1 \rangle 1$. If the Axiom of Choice is true then, for any set I and any function H with domain I, if $H(i) \neq \emptyset$ for all $i \in I$, then $\prod_{i \in I} H(i) \neq \emptyset$.
   $\langle 2 \rangle 1$. ASSUME: The Axiom of Choice.
   $\langle 2 \rangle 2$. LET: I be a set.
   $\langle 2 \rangle 3$. LET: H be a function with domain I.

⟨2⟩4. ASSUME: $H(i) \neq \emptyset$ for all $i \in I$.
⟨2⟩5. LET: $R = \{(i, x) : i \in I, x \in H(i)\}$
⟨2⟩6. PICK a function $F \subseteq R$ with $\operatorname{dom} F = \operatorname{dom} R$
      PROVE: $F \in \prod_{i \in I} H(i)$
  PROOF: By the Axiom of Choice.
⟨2⟩7. $\operatorname{dom} H = I$
  PROOF: We have $\operatorname{dom} R = I$ since for all $i \in I$ there exists x such that $x \in H(i)$.
⟨2⟩8. $\forall i \in I.F(i) \in H(i)$
  PROOF: Since $iRF(i)$.
⟨1⟩2. If, for any set I and any function H with domain I, if $H(i) \neq \emptyset$ for all $i \in I$, then $\prod_{i \in I} H(i) \neq \emptyset$, then the Axiom of Choice is true.
  ⟨2⟩1. ASSUME: For any set I and any function H with domain I, if $H(i) \neq \emptyset$ for all $i \in I$, then $\prod_{i \in I} H(i) \neq \emptyset$
  ⟨2⟩2. LET: R be a relation
  ⟨2⟩3. LET: $I = \operatorname{dom} R$
  ⟨2⟩4. Define the function H with domain I by: for $i \in I$, $H(i) = \{y : iRy\}$
  ⟨2⟩5. $H(i) \neq \emptyset$ for all $i \in I$
  ⟨2⟩6. PICK $F \in \prod_{i \in I} H(i)$
    PROOF: By ⟨2⟩1
  ⟨2⟩7. F is a function
  ⟨2⟩8. $F \subseteq R$
    PROOF: For all $i \in I$ we have $F(i) \in H(i)$ and so $iRF(i)$.
  ⟨2⟩9. $\operatorname{dom} F = \operatorname{dom} R$
☐

Theorem 74. *The following are equivalent.*

1. *The Axiom of Choice.*

2. *Let $\mathcal{A}$ be a set such that (a) every member of $\mathcal{A}$ is a nonempty set, and (b) any two distinct members of $\mathcal{A}$ are disjoint. Then there exists a set C such that, for all $B \in \mathcal{A}$, we have $C \cap B$ is a singleton.*

3. *For any set A, there exists a function $F : \mathcal{P}A - \{\emptyset\} \to A$ such that $F(X) \in X$ for all $X \in \mathcal{P}A - \{\emptyset\}$.*

PROOF:
⟨1⟩1. $1 \Rightarrow 2$
  PROOF: Let $\mathcal{A}$ be a set matching the two condtions. By the Multiplicative Axiom, pick a function $f \in \prod_{B \in \mathcal{A}} B$. Let $C = \operatorname{ran} f$. Then $C \cap B = \{f(B)\}$ for all $B \in \mathcal{A}$.
⟨1⟩2. $2 \Rightarrow 3$
  ⟨2⟩1. ASSUME: 2
  ⟨2⟩2. LET: A be a set.
  ⟨2⟩3. LET: $\mathcal{A} = \{\{B\} \times B : B \in \mathcal{P}A - \{\emptyset\}\}$
  ⟨2⟩4. PICK a set C such that $C \cap (\{B\} \times B)$ is a singleton for all $B \in \mathcal{P}A - \{\emptyset\}$
  ⟨2⟩5. LET: $F = C \cap \bigcup \mathcal{A}$

⟨2⟩6. $F : \mathcal{P}A - \{\emptyset\} \to A$ is a function and $F(X) \in X$ for all X
⟨1⟩3. $3 \Rightarrow 1$
  ⟨2⟩1. ASSUME: 3
  ⟨2⟩2. LET: R be a relation
  ⟨2⟩3. PICK a choice function G for $\operatorname{ran} R$
  ⟨2⟩4. Define $F : \operatorname{dom} R \to \operatorname{ran} R$ by $F(x) = G(R(x))$
  ⟨2⟩5. $F \subseteq R$
□

10 Equivalence Relations

Definition 75 (Equivalence Relation). An *equivalence relation* on $\mathbf{A}$ is a binary relation on $\mathbf{A}$ that is reflexive on $\mathbf{A}$, symmetric and transitive.

Theorem 76. *If* $\mathbf{R}$ *is a symmetric and transitive relation then* $\mathbf{R}$ *is an equivalence relation on* $\operatorname{fld} \mathbf{R}$.

PROOF:
⟨1⟩1. LET: $x \in \operatorname{fld} \mathbf{R}$
⟨1⟩2. PICK y such that either $x\mathbf{R}y$ or $y\mathbf{R}x$
⟨1⟩3. $x\mathbf{R}y$ and $y\mathbf{R}x$
  PROOF: Since $\mathbf{R}$ is symmetric.
⟨1⟩4. $x\mathbf{R}x$
  PROOF: Since $\mathbf{R}$ is transitive.
□

Definition 77 (Equivalence Class). If $\mathbf{R}$ is an equivalence relation and $x \in \operatorname{fld} \mathbf{R}$, the *equivalence class* of x modulo $\mathbf{R}$ is

$$[x]_{\mathbf{R}} = \{t : x\mathbf{R}t\} \ .$$

Lemma 78. *Assume that* $\mathbf{R}$ *is an equivalence relation on* $\mathbf{A}$ *and that* x *and* y *belong to* $\mathbf{A}$*. Then*
$$[x]_{\mathbf{R}} = [y]_{\mathbf{R}} \ \textit{iff} \ x\mathbf{R}y \ .$$

PROOF:
⟨1⟩1. If $[x]_{\mathbf{R}} = [y]_{\mathbf{R}}$ then $x\mathbf{R}y$
  ⟨2⟩1. ASSUME: $[x]_{\mathbf{R}} = [y]_{\mathbf{R}}$
  ⟨2⟩2. $y \in [y]_{\mathbf{R}}$
    PROOF: Since $\mathbf{R}$ is reflexive on $\mathbf{A}$.
  ⟨2⟩3. $y \in [x]_{\mathbf{R}}$
  ⟨2⟩4. $x\mathbf{R}y$
⟨1⟩2. If $x\mathbf{R}y$ then $[x]_{\mathbf{R}} = [y]_{\mathbf{R}}$
  ⟨2⟩1. ASSUME: $x\mathbf{R}y$
  ⟨2⟩2. $[y]_{\mathbf{R}} \subseteq [x]_{\mathbf{R}}$
    ⟨3⟩1. LET: $z \in [y]_{\mathbf{R}}$
    ⟨3⟩2. $y\mathbf{R}z$

$\langle 3\rangle 3.$ $x\mathbf{R}z$
  PROOF: Since $\mathbf{R}$ is transitive.
$\langle 3\rangle 4.$ $z \in [x]_{\mathbf{R}}$
$\langle 2\rangle 3.$ $y\mathbf{R}x$
  PROOF: Since $\mathbf{R}$ is symmetric.
$\langle 2\rangle 4.$ $[x]_{\mathbf{R}} \subseteq [y]_{\mathbf{R}}$
  PROOF: Similar.
□

Definition 79 (Partition)**.** A *partition* of a set A is a set $P \subseteq \mathcal{P}A$ such that:

- Every member of P is nonempty.

- Any two distinct members of P are disjoint.

- $A = \bigcup P$

Theorem 80. *Let R be an equivalence relation on the set A. Then the set of all equivalence classes is a partition of A.*

PROOF:
$\langle 1\rangle 1.$ Every equivalence class is nonempty.
  PROOF: For any $x \in A$ we have $x \in [x]_R$.
$\langle 1\rangle 2.$ Any two distinct equivalence classes are disjoint.
  $\langle 2\rangle 1.$ LET: $x, y \in A$
  $\langle 2\rangle 2.$ ASSUME: $z \in [x]_R \cap [y]_R$
        PROVE: $[x]_R = [y]_R$
  $\langle 2\rangle 3.$ xRy
    $\langle 3\rangle 1.$ xRz
    $\langle 3\rangle 2.$ yRz
    $\langle 3\rangle 3.$ zRy
      PROOF: By $\langle 3\rangle 2$ and symmetry.
    $\langle 3\rangle 4.$ xRy
      PROOF: By $\langle 3\rangle 1$, $\langle 3\rangle 3$ and transitivity.
  $\langle 2\rangle 4.$ $[x]_R = [y]_R$
    PROOF: By Lemma 3N.
$\langle 1\rangle 3.$ A is the union of all the equivalence classes.
  PROOF: For any $x \in A$ we have $x \in [x]_R$.
□

Definition 81 (Quotient Set)**.** If R is an equivalence relation on the set A, then the *quotient set A/R* is the set of all equivalence classes, and the *natural map* or *canonical map* $\phi : A \to A/R$ is defined by $\phi(x) = [x]_R$.

Theorem 82. *Assume that R is an equivalence relation on A and that $F : A \to B$. Assume that F is* compatible *with R; that is, whenever xRy, then $F(x) = F(y)$. Then there exists a unique $\overline{F} : A/R \to B$ such that $F = \overline{F} \circ \phi$.*

PROOF: The unique such $\overline{F}$ is $\{([x], F(x)) : x \in A\}$. □

11   Well-Founded Relations

Definition 83 (Well Founded). A relation R on a class D is *well-founded* iff every nonempty subset of D has an R-minimal element.

Theorem 84 (Transfinite Induction). *Let R be a well-founded relation on A. Let $B \subseteq A$. Assume that, for all $x \in A$, if $\forall y \in A(yRx \Rightarrow y \in B)$, then $x \in B$. Then $B = A$.*

PROOF: If not, $A - B$ has an R-minimal element a_0, say. But then we have $\forall y.(yRa_0 \Rightarrow y \in B)$ and $a_0 \notin B$, which is a contradiction. $\square$

Theorem 85 (Transfinite Recursion Theorem Schema). *For any property $P(x, y, z)$ the following is a theorem:*
  Assume that $<$ is a well-founded relation on A. Assume that $\forall x, y \exists! z P(x, y, z)$. Then there exists a unique function F with domain A such that

$$\forall t \in A.P(F \restriction \operatorname{seg} t, t, F(t)) \ .$$

PROOF:

$\langle 1 \rangle 1$. Given $t \in A$, let us say that a function v is *P-constructed up to t* iff $\operatorname{dom} v = \{x \in A : x \leq t\}$ and $\forall x \in \operatorname{dom} v.P(v \restriction \operatorname{seg} x, x, v(x))$

$\langle 1 \rangle 2$. Let $t_1, t_2 \in A$ with $t_1 \leq t_2$. Let v_1 be a function that is P-constructed up to t_1, and v_2 a function that is P-constructed up to t_2. Then $\forall x \leq t_1.v_1(x) = v_2(x)$

  $\langle 2 \rangle 1$. LET: $x \leq t_1$
  $\langle 2 \rangle 2$. ASSUME: $\forall y < x.v_1(y) = v_2(y)$
  $\langle 2 \rangle 3$. $v_1 \restriction \operatorname{seg} x = v_2 \restriction \operatorname{seg} x$
  $\langle 2 \rangle 4$. $P(v_1 \restriction \operatorname{seg} x, v_1(x))$
  $\langle 2 \rangle 5$. $P(v_2 \restriction \operatorname{seg} x, v_2(x))$
  $\langle 2 \rangle 6$. $v_1(x) = v_2(x)$
    PROOF: Since there is only one y such that $P(v_1 \restriction \operatorname{seg} x, x, y)$.
  $\langle 2 \rangle 7$. Q.E.D.
    PROOF: By transfinite induction.

$\langle 1 \rangle 3$. LET: $\mathcal{H} = \{v : \exists t \in A.v \text{ is } P\text{-constructed up to } t\}$

$\langle 1 \rangle 4$. $\mathcal{H}$ is a set.
  PROOF: By a Replacement Axiom since, if v_1 and v_2 are both P-constructed up to t then $v_1 = v_2$ by $\langle 1 \rangle 2$.

$\langle 1 \rangle 5$. LET: $F = \bigcup \mathcal{H}$

$\langle 1 \rangle 6$. F is a function
  $\langle 2 \rangle 1$. ASSUME: tFx and tFy
  $\langle 2 \rangle 2$. PICK $v_1, v_2 \in \mathcal{H}$ such that $v_1(t) = x$ and $v_2(t) = y$
  $\langle 2 \rangle 3$. PICK $t_1, t_2 \in A$ such that v_1 is P-constructed up to t_1 and v_2 is P-constructed up to t_2
  $\langle 2 \rangle 4$. ASSUME: w.l.o.g. $t_1 \leq t_2$
  $\langle 2 \rangle 5$. $v_1(t) = v_2(t)$
    PROOF: By $\langle 1 \rangle 2$

$\langle 2 \rangle 6. \ x = y$

$\langle 1 \rangle 7. \ \forall x \in \operatorname{dom} F.P(F \restriction \operatorname{seg} x, x, F(x))$

   $\langle 2 \rangle 1.$ LET: $x \in \operatorname{dom} F$

   $\langle 2 \rangle 2.$ PICK $v \in \mathcal{H}$ such that $x \in \operatorname{dom} v$

   $\langle 2 \rangle 3. \ P(v \restriction \operatorname{seg} x, x, v(x))$

   $\langle 2 \rangle 4. \ v \restriction \operatorname{seg} x = F \restriction \operatorname{seg} x$

     PROOF: $\forall y < x.(y, v(y)) \in \bigcup \mathcal{H} = F$

   $\langle 2 \rangle 5. \ v(x) = F(x)$

     PROOF: $(x, v(x)) \in \bigcup \mathcal{H} = F$

$\langle 1 \rangle 8. \ \operatorname{dom} F = A$

   $\langle 2 \rangle 1.$ LET: $x \in A$

   $\langle 2 \rangle 2.$ ASSUME: $\forall y < x.y \in \operatorname{dom} F$

   $\langle 2 \rangle 3.$ LET: z be the object such that $P(F \restriction \operatorname{seg} x, z)$

   $\langle 2 \rangle 4. \ F \restriction \operatorname{seg} x \cup \{(x, z)\}$ is P-constructed up to x

   $\langle 2 \rangle 5. \ x \in \operatorname{dom} F$

   $\langle 2 \rangle 6.$ Q.E.D.

     PROOF: By transfinite induction, this proves $\forall x \in A.x \in \operatorname{dom} F$.

$\langle 1 \rangle 9. \ F$ is unique.

   $\langle 2 \rangle 1.$ LET: G be a function with domain A such that $\forall x \in A.P(G \restriction \operatorname{seg} x, x, G(x))$

     PROVE: $\forall x \in A.F(x) = G(x)$

   $\langle 2 \rangle 2.$ LET: $x \in A$

   $\langle 2 \rangle 3.$ ASSUME: $\forall y < x.F(y) = G(y)$

   $\langle 2 \rangle 4. \ F \restriction \operatorname{seg} x = G \restriction \operatorname{seg} x$

   $\langle 2 \rangle 5. \ F(x) = G(x)$

   $\langle 2 \rangle 6.$ Q.E.D.

     PROOF: This completes the proof by transfinite induction.

  □

12 Transitive Closure

Theorem 86. *For any relation R on a set A, there exists a least transitive relation R^t such that $R \subseteq R^t$.*

PROOF: Define R^t to be the intersection of all the transitive relations Q such that $R \subseteq Q$. □

Theorem 87. *The transitive closure of a well-founded relation is well-founded.*

PROOF: The R-minimal element of a nonempty set B is also the R^t-minimal element. □

13 Partial Orders

Definition 88 (Strict Partial Order). A *strict partial order* is an irreflexive, transitive relation.

If $<$ is a strict partial order, we write $x \leq y$ for $x < y \vee x = y$.

Theorem 89. *Assume that $<$ is a partial order. Then for any x, y and z:*

1. *At most* one of the three alternatives,

$$x < y, x = y, y < x,$$

   can hold.

2. $x \leq y \leq x \Rightarrow x = y$.

PROOF: Easy. □

Definition 90 (Maximal). Let $<$ be a partial order on D. An element $m \in D$ is *maximal* iff there is no $x \in D$ such that $m < x$.

Definition 91 (Least). Let $<$ be a partial order on D. An element $m \in D$ is *least*, *smallest* or the *minimum* iff $\forall x \in D . m \leq x$.

Definition 92 (Greatest). Let $<$ be a partial order on D. An element $m \in D$ is *greatest*, *largest* or the *maximum* iff $\forall x \in D . x \leq m$.

Proposition 93. *If R is a partial ordering on D then so is R^{-1}.*

PROOF: Easy. □

Definition 94 (Upper Bound). Let $<$ be a partial order on A and $C \subseteq A$. An *upper bound* for C is an element $b \in A$ such that $\forall x \in C . x \leq b$.

Definition 95 (Least Upper Bound). Let $<$ be a partial order on A and $C \subseteq A$. The *least upper bound* or *supremum* for C is the least element in the set of upper bounds for C.

Definition 96 (Lower Bound). Let $<$ be a partial order on A and $C \subseteq A$. A *lower bound* for C is an element $b \in A$ such that $\forall x \in C . b \leq x$.

Definition 97 (Greatest Lower Bound). Let $<$ be a partial order on A and $C \subseteq A$. The *greatest lower bound* or *infimum* for C is the greatest element in the set of lower bounds for C.

Definition 98 (Initial Segment). Let $<$ be a partial order on A and $t \in A$. The *initial segment* up to t is

$$\operatorname{seg} t = \{x \in A : x < t\} \ .$$

Definition 99 (Isomorphism). Let A and B be posets. An *isomorphism* between A and B is a bijection f between A and B such that, for all $x, y \in A$, we have $x < y$ if and only if $f(x) < f(y)$.

Proposition 100. *Isomorphism is an equivalence relation on the class of posets.*

PROOF: Easy. □

Proposition 101. *Let $(A, <)$ be a poset and $B \subseteq A$. Then $< \cap B^2$ is a partial order on B.*

PROOF: Easy. □

Theorem 102. *Let R be a well-founded relation on A. The transitive closure of R is a partial order on A.*

PROOF: It is well founded, hence irreflexive. □

14 Linear Orders

Definition 103 (Linear Ordering)**.** Let $\mathbf{A}$ be a class. A *linear ordering* or *total ordering* on $\mathbf{A}$ is a relation $\mathbf{R}$ on $\mathbf{A}$ such that:

- $\mathbf{R}$ is transitive.

- $\mathbf{R}$ satisfies *trichotomy* on $\mathbf{A}$; i.e. for any $x, y \in \mathbf{A}$, exactly one of

$$x\mathbf{R}y, x = y, y\mathbf{R}x$$

holds.

Theorem 104. *Let $\mathbf{R}$ be a linear ordering on $\mathbf{A}$.*

1. *There is no x such that $x\mathbf{R}x$.*

2. *For distinct x and y in $\mathbf{A}$, either $x\mathbf{R}y$ or $y\mathbf{R}x$.*

PROOF: Immediate from trichotomy. □

Definition 105 (Strictly Monotone Functions)**.** Let A and B be linearly ordered sets. A function $f : A \to B$ is *strictly monotone* iff, for all $x, y \in A$, if $x < y$ then $f(x) < f(y)$.

Theorem 106. *Let A and B be linearly ordered sets and $f : A \to B$ be strictly monotone. For all $x, y \in A$, if $f(x) < f(y)$ then $x < y$.*

PROOF: We have $f(x) \neq f(y)$ and $f(y) \not< f(x)$ by trichotomy, hence $x \neq y$ and $y \not< x$ since f is strictly monotone, hence $x < y$ by trichotomy. □

Theorem 107. *Every strictly monotone function is injective.*

PROOF: If $f(x) = f(y)$, then we have $f(x) \not< f(y)$ and $f(y) \not< f(x)$ by trichotomy, hence $x \not< y$ and $y \not< x$ since f is strictly monotone, hence $x = y$ by trichotomy. □

Proposition 108. *Let $(A, <)$ be a linearly ordered set and $B \subseteq A$. Then $< \cap B^2$ is a linear order on B.*

PROOF: Easy. □

Definition 109. Let A and B be disjoint linearly ordered sets. The *concatenation* of A and B, $A \oplus B$, is the set $A \cup B$ under the order given by: $x < y$ iff

- $x, y \in A$ and $x < y$; or

- $x, y \in B$ and $x < y$; or

- $x \in A$ and $y \in B$.

It is easy to check this is a linear ordering.

Proposition 110.
$$A \oplus (B \oplus C) = (A \oplus B) \oplus C$$

PROOF: Easy. □

Proposition 111.
$$A \oplus \emptyset = \emptyset \oplus A = A$$

PROOF: Easy. □

Definition 112. Let A and B be linearly ordered sets. The *lexicographic order* on $A \times B$ is defined by: $(a_1, b_1) < (a_2, b_2)$ iff $a_1 < a_2$ or $(a_1 = a_2$ and $b_1 < b_2)$.

Proposition 113. *These two orders on $A \times B \times C$ are equal:*

- *lexicographic order formed from (lexicographic order on $A \times B$) and order on C*

- *lexicographic order formed from order on A and (lexicographic order on $B \times C$)*

PROOF: Easy. □

Proposition 114.
$$A \times 1 = 1 \times A = A$$

PROOF: Easy. □

Proposition 115. $A \times (B \oplus C) = (A \times B) \oplus (A \times C)$

PROOF: Easy. □

15 Well Orderings

Definition 116 (Well Ordering)**.** A *well ordering* on a set A is a linear ordering on A such that every nonempty subset of A has a least element.

Theorem 117. *Assume that $<$ is a linear ordering on A. Assume that the only $<$-inductive subset of A is A itself. Then $<$ is a well ordering on A.*

PROOF:
⟨1⟩1. ASSUME: for a contradiction $B \subseteq A$ has no least element.
⟨1⟩2. $A - B$ is $<$-inductive.
  ⟨2⟩1. LET: $t \in A$
  ⟨2⟩2. ASSUME: $\operatorname{seg} t \subseteq A - B$
  ⟨2⟩3. $t \notin B$
    PROOF: If it were, it would be the least element of B.
  ⟨2⟩4. $t \in A - B$
⟨1⟩3. $A - B = A$
⟨1⟩4. $B = \emptyset$
☐

Proposition 118. *Let $(A, <)$ be a well ordered set and $B \subseteq A$. Then $< \cap B^2$ is a well order on B.*

PROOF: Easy. ☐

Theorem 119. *Let A and B be well-ordered sets. Then one of the following holds:*

- *$A \cong B$*

- *$\exists b \in B. A \cong \operatorname{seg} b$*

- *$\exists a \in A. \operatorname{seg} a \cong B$*

PROOF:
⟨1⟩1. PICK e that is not a member of A or B
⟨1⟩2. Define $F : A \to B \cup \{e\}$ by:
$$F(t) = \begin{cases} \text{the least element of } B - F(\operatorname{seg} t) & \text{if } B - F(\operatorname{seg} t) \neq \emptyset \\ e & \text{if } B - F(\operatorname{seg} t) = \emptyset \end{cases}$$
⟨1⟩3. CASE: $e \in \operatorname{ran} F$
  ⟨2⟩1. LET: $a \in A$ be least such that $B - F(\operatorname{seg} a) = \emptyset$
  ⟨2⟩2. $F \upharpoonright \operatorname{seg} a : \operatorname{seg} a \cong B$
⟨1⟩4. CASE: $\operatorname{ran} F = B$
  PROOF: In this case $F : A \cong B$.
⟨1⟩5. CASE: $\operatorname{ran} F \subset B$
  ⟨2⟩1. LET: $b \in B$ be least such that $b \notin \operatorname{ran} F$
  ⟨2⟩2. $F : A \cong \operatorname{seg} b$
☐

Theorem 120. *The concatenation of two well-orderings is a well ordering.*

PROOF: Easy. ☐

Theorem 121. *The lexicographic ordering on the product of two well-ordered sets is a well ordering.*

PROOF: Easy. ☐

16   Epsilon-Images

Lemma 122. *Let $<$ be a well ordering on A. Let E be the function on A defined by transfinite recursion thus:*

$$E(t) = \{E(x) : x < t\} \qquad (t \in A) \ .$$

Let $\alpha = \operatorname{ran} E$. Then:

1. *$\forall t \in A.E(t) \notin E(t)$*

2. *E is injective.*

3. *$\forall s, t \in A.(s < t \Leftrightarrow E(s) \in E(t))$*

4. *α is a transitive set.*

PROOF:
$\langle 1 \rangle 1.$ $\forall t \in A.E(t) \notin E(t)$
  $\langle 2 \rangle 1.$ LET: $t \in A$
  $\langle 2 \rangle 2.$ ASSUME: $\forall s < t.E(s) \notin E(s)$
  $\langle 2 \rangle 3.$ ASSUME: for a contradiction $E(t) \in E(t)$
  $\langle 2 \rangle 4.$ PICK $x < t$ such that $E(t) = E(x)$
  $\langle 2 \rangle 5.$ $E(x) \in E(x)$
  $\langle 2 \rangle 6.$ Q.E.D.
    PROOF: This is a contradiction. The result follows by transfinite induction.
$\langle 1 \rangle 2.$ E is injective.
  $\langle 2 \rangle 1.$ ASSUME: for a contradiction $E(x) = E(y)$ where $x \neq y$
  $\langle 2 \rangle 2.$ ASSUME: w.l.o.g. $x < y$
  $\langle 2 \rangle 3.$ $E(x) \in E(y)$
  $\langle 2 \rangle 4.$ Q.E.D.
    PROOF: This contradicts $\langle 1 \rangle 1$.
$\langle 1 \rangle 3.$ $\forall s, t \in A(s < t \Leftrightarrow E(s) \in E(t))$
  $\langle 2 \rangle 1.$ LET: $s, t \in A$
  $\langle 2 \rangle 2.$ If $s < t$ then $E(s) \in E(t)$
    PROOF: Immediate from definition of E.
  $\langle 2 \rangle 3.$ If $E(s) \in E(t)$ then $s < t$
    $\langle 3 \rangle 1.$ ASSUME: $E(s) \in E(t)$
    $\langle 3 \rangle 2.$ PICK $x < t$ such that $E(s) = E(x)$
    $\langle 3 \rangle 3.$ $s = x$
      PROOF: $\langle 1 \rangle 2$.
    $\langle 3 \rangle 4.$ $s < t$
$\langle 1 \rangle 4.$ α is a transitive set.
  PROOF: From definition of E.

Corollary 122.1. *For any well-ordered set $(A, <)$, if α is its epsilon-image, then $(A, <)$ is isomorphic to $(\alpha, \in)$.*

Corollary 122.2. *The epsilon-image of any well-ordered set is well ordered by $\in$.*

Theorem 123. *Two well-ordered sets are isomorphic iff they have the same ϵ-image.*

PROOF:
⟨1⟩1. LET: A and B be well-ordered sets.
⟨1⟩2. If A and B have the same ϵ-image then they are isomorphic.
   PROOF: From Corollary 122.1.
⟨1⟩3. If $A \cong B$ then A and B have the same epsilon-image.
  ⟨2⟩1. LET: $f : A \cong B$
  ⟨2⟩2. LET: $E : A \cong \alpha$ and $F : B \cong \beta$ be the canonical isomorphisms between
          A and B and their epsilon-images.
  ⟨2⟩3. $\forall x \in A.E(x) = F(f(x))$
    ⟨3⟩1. LET: $x \in A$
    ⟨3⟩2. ASSUME: $\forall y < x.E(y) = F(f(y))$
    ⟨3⟩3. $E(x) = F(f(x))$
      PROOF:

$$\begin{aligned}
E(x) &= \{E(y) : y < x\} \\
&= \{F(f(y)) : y < x\} \\
&= \{F(z) : z < f(x)\} \\
&= F(f(x))
\end{aligned}$$

  ⟨2⟩4. $\alpha = \beta$
☐

17   Ordinal Numbers

Definition 124 (Ordinal Number). The *ordinal number* of a well-ordered set is its epsilon-image.

Definition 125 (Well-ordered by Epsilon). A set A is *well-ordered by epsilon* iff $\{(x,y) : x,y \in A, x \in y\}$ is a well ordering on A.

Theorem 126. *A set is an ordinal number if and only if it is a transitive set that is well-ordered by epsilon.*

PROOF:
⟨1⟩1. Every ordinal number is a transitive set.
   PROOF: Lemma 122.
⟨1⟩2. Every ordinal number is well-ordered by epsilon.
   PROOF: Corollary 122.2.
⟨1⟩3. Every transitive set that is well-ordered by epsilon is an ordinal number.
  ⟨2⟩1. LET: α be a transitive set well-ordered by epsilon.
  ⟨2⟩2. LET: β be the epsilon-image of $(\alpha, \in)$ with $E : \alpha \cong \beta$ the canonical
          isomorphism.
  ⟨2⟩3. $\forall x \in \alpha.E(x) = x$
    ⟨3⟩1. LET: $x \in \alpha$
    ⟨3⟩2. ASSUME: $\forall y < x.E(y) = y$

⟨3⟩3. $E(x) = x$
PROOF:

$$
\begin{aligned}
E(x) &= \{E(y) : y \in \alpha, y \in x\} \\
&= \{E(y) : y \in x\} && (\alpha \text{ is a transitive set}) \\
&= \{y : y \in x\} && (\langle 3\rangle 2) \\
&= x
\end{aligned}
$$

⟨2⟩4. $\alpha = \beta$

□

Theorem 127. *Every member of an ordinal number is an ordinal number.*

PROOF:
⟨1⟩1. LET: α be an ordinal number.
⟨1⟩2. LET: $\beta \in \alpha$
⟨1⟩3. β is a transitive set.
  ⟨2⟩1. LET: $x \in y \in \beta$
  ⟨2⟩2. $y \in \alpha$
    PROOF: Since α is a transitive set.
  ⟨2⟩3. $x \in \alpha$
    PROOF: Since α is a transitive set.
  ⟨2⟩4. $x \in \beta$
    PROOF: Since α is a partially ordered by epsilon.
⟨1⟩4. β is well-ordered by epsilon.
  PROOF: Since $\{(x,y) : x, y \in \beta, x \in y\}$ is the restriction of $\{(x,y) : x, y \in \alpha, x \in y\}$ to β.
⟨1⟩5. β is an ordinal number.
  PROOF: Theorem 126.

□

Proposition 128. *The class of ordinals is well-ordered by epsilon.*

PROOF:
⟨1⟩1. For any ordinals α, β, γ, if $\alpha \in \beta \in \gamma$ then $\alpha \in \gamma$.
  PROOF: Since γ is a transitive set (Lemma 122).
⟨1⟩2. For any ordinal α we have $\alpha \notin \alpha$.
  PROOF: Since α is well-ordered by epsilon.
⟨1⟩3. For any ordinals α, β, exactly one of $\alpha \in \beta$, $\beta \in \alpha$, $\alpha = \beta$ holds.
  ⟨2⟩1. LET: α, β be ordinals.
  ⟨2⟩2. Either $\alpha \cong \beta$ or $\exists \gamma \in \beta.\alpha \cong \gamma$ or $\exists \gamma \in \alpha.\gamma \cong \alpha$
    PROOF: Theorem 119.
  ⟨2⟩3. Either $\alpha = \beta$ or $\exists \gamma \in \beta.\alpha = \gamma$ or $\exists \gamma \in \alpha.\gamma = \alpha$
    PROOF: Since any ordinal is its own epsilon-image, and isomorphic well-orderings have equal epsilon-images.
⟨1⟩4. Any nonempty set of ordinals has a least element.
  ⟨2⟩1. LET: A be a nonempy set of ordinals.
  ⟨2⟩2. PICK $\alpha \in A$
  ⟨2⟩3. CASE: $A \cap \alpha = \emptyset$

Proof: In this case, α is least in A.
$\langle 2 \rangle 4$. Case: $A \cap \alpha \neq \emptyset$
    Proof: In this case, the least element of $A \cap \alpha$ is the least element in A.
$\square$

Corollary 128.1. *Any transitive set of ordinal numbers is an ordinal number.*

Corollary 128.2. $\emptyset$ *is an ordinal number.*

    We write 0 for $\emptyset$ considered as an ordinal number.

Definition 129 (Successor)**.** The *successor* of a set a is the set $a^+ = a \cup \{a\}$.

Corollary 129.1. *The successor of an ordinal number is an ordinal number.*

Corollary 129.2. *For any set A of ordinal numbers, the set $\bigcup A$ is an ordinal number.*

Theorem 130 (Burali-Forti)**.** *The class of ordinal numbers is not a set.*

Proof:
$\langle 1 \rangle 1$. Assume: for a contradiction the class **On** is a set.
$\langle 1 \rangle 2$. **On** is an ordinal number.
    Proof: Corollary 128.1.
$\langle 1 \rangle 3$. **On** $\in$ **On**
$\langle 1 \rangle 4$. Q.E.D.
    Proof: This contradicts Lemma 122.
$\square$

Theorem 131 (Hartogs)**.** *For any set A, there exists an ordinal not dominated by A.*

Proof:
$\langle 1 \rangle 1$. Let: A be a set.
$\langle 1 \rangle 2$. Let: $\alpha = \{\beta : \beta \text{ is an ordinal }, \beta \preccurlyeq A\}$.
$\langle 1 \rangle 3$. Let: $W = \{(B, <) : B \subseteq A, < \text{ is a well ordering on } B\}$
$\langle 1 \rangle 4$. $\forall \beta \in \alpha. \exists (B, <) \in W. \beta$ is the epsilon-image of $(B, <)$
    $\langle 2 \rangle 1$. Let: $\beta \in \alpha$
    $\langle 2 \rangle 2$. Pick an injection $f : \beta \to A$
    $\langle 2 \rangle 3$. Define $<$ on $f(\beta)$ by: $f(\gamma) < f(\delta)$ iff $\gamma \in \delta$
    $\langle 2 \rangle 4$. $<$ well orders $f(\beta)$
    $\langle 2 \rangle 5$. β is the epsilon-image of $(f(\beta), <)$ with f^{-1} the canonical isomorphism.
$\langle 1 \rangle 5$. α is a set.
    Proof: By a Replacement Axiom applied to W.
$\langle 1 \rangle 6$. α is an ordinal.
    $\langle 2 \rangle 1$. α is a transitive set.
        $\langle 3 \rangle 1$. Let: $\beta \in \gamma \in \alpha$
        $\langle 3 \rangle 2$. $\beta \subseteq \gamma \preccurlyeq A$
        $\langle 3 \rangle 3$. $\beta \preccurlyeq A$

$\langle 3 \rangle 4.\ \beta \in \alpha$
$\langle 2 \rangle 2.$ Q.E.D.
    PROOF: By Corollary 128.1.
$\langle 1 \rangle 7.\ \alpha \not\preceq A$
  PROOF: Because $\alpha \notin \alpha$.
□

Theorem 132 (Zorn's Lemma). *The following statements are equivalent:*

    1. The Axiom of Choice

Well-Ordering Theorem For any set A, there exists a well ordering on A.

    Zorn's Lemma Let $\mathcal{A}$ be a set such that, for every chain $\mathcal{B} \subseteq \mathcal{A}$, we have $\bigcup \mathcal{B} \in \mathcal{A}$. Then $\mathcal{A}$ has a maximal element.

PROOF:
$\langle 1 \rangle 1.$ If the Axiom of Choice is true then the Well-Ordering Theorem is true.
  $\langle 2 \rangle 1.$ ASSUME: The Axiom of Choice
  $\langle 2 \rangle 2.$ LET: A be any set.
  $\langle 2 \rangle 3.$ PICK an ordinal α not dominated by A.
  $\langle 2 \rangle 4.$ PICK an object e such that $e \notin A$.
  $\langle 2 \rangle 5.$ PICK a choice function $G : \mathcal{P}A - \{\emptyset\} \to A$ for A.
  $\langle 2 \rangle 6.$ Define the function $F : \alpha \to A \cup \{e\}$ by transfinite recursion thus:
$$F(\gamma) = \begin{cases} G(A - \{F(\delta) : \delta < \gamma\}) & \text{if } A - \{F(\delta) : \delta < \gamma\} \neq \emptyset \\ e & \text{if } A - \{F(\delta) : \delta < \gamma\} = \emptyset \end{cases}$$
  $\langle 2 \rangle 7.$ LET: δ be least such that $F(\delta) = e$
    PROOF: There is such a δ, otherwise F would be a bijection between α and A.
  $\langle 2 \rangle 8.$ $F \upharpoonright \delta$ is a bijection between δ and A
  $\langle 2 \rangle 9.$ Define $<$ on A by: $F(\gamma) < F(\beta)$ iff $\gamma \in \beta$ for $\gamma, \beta \in \delta$
  $\langle 2 \rangle 10.$ $<$ is a well ordering on A.
$\langle 1 \rangle 2.$ If the Well-Ordering Theorem is true then Zorn's Lemma is true.
  $\langle 2 \rangle 1.$ ASSUME: The Well-Ordering Theorem
  $\langle 2 \rangle 2.$ LET: $\mathcal{A}$ be a set that is closed under unions of chains.
  $\langle 2 \rangle 3.$ PICK a well ordering $<$ on $\mathcal{A}$
  $\langle 2 \rangle 4.$ Define the function $F : \mathcal{A} \to 2$ by transfinite recursion thus:
$$F(A) = \begin{cases} 1 & \text{if } \forall B < A. F(B) = 1 \Rightarrow B \subseteq A \\ 0 & \text{otherwise} \end{cases}$$
  $\langle 2 \rangle 5.$ LET: $\mathcal{C} = \{A \in \mathcal{A} : F(A) = 1\}$
  $\langle 2 \rangle 6.$ $\mathcal{C}$ is a chain.
    $\langle 3 \rangle 1.$ LET: $A, B \in \mathcal{C}$
    $\langle 3 \rangle 2.$ ASSUME: w.l.o.g. $A < B$
    $\langle 3 \rangle 3.$ $F(A) = 1$
    $\langle 3 \rangle 4.$ $F(B) = 1$
    $\langle 3 \rangle 5.$ $A \subseteq B$
  $\langle 2 \rangle 7.$ $\bigcup \mathcal{C} \in \mathcal{A}$

PROOF: By $\langle 2 \rangle 2$.

$\langle 2 \rangle 8$. $\bigcup \mathcal{C}$ is maximal in $\mathcal{A}$

    $\langle 3 \rangle 1$. ASSUME: $\bigcup \mathcal{C} \subseteq D \in \mathcal{A}$

    $\langle 3 \rangle 2$. $\forall B < D.F(B) = 1 \Rightarrow B \subseteq D$

      PROOF: If $F(B) = 1$ then $B \in \mathcal{C}$ so $B \subseteq \bigcup \mathcal{C} \subseteq D$.

    $\langle 3 \rangle 3$. $F(D) = 1$

    $\langle 3 \rangle 4$. $D \in \mathcal{C}$

    $\langle 3 \rangle 5$. $D = \bigcup \mathcal{C}$

$\langle 1 \rangle 3$. If Zorn's Lemma is true then the Axiom of Choice is true.

    $\langle 2 \rangle 1$. ASSUME: Zorn's Lemma

    $\langle 2 \rangle 2$. LET: R be a relation.

    $\langle 2 \rangle 3$. LET: $\mathcal{A}$ be the set of all functions that are subsets of R.

    $\langle 2 \rangle 4$. For any chain $\mathcal{B} \subseteq \mathcal{A}$ we have $\bigcup \mathcal{B} \in \mathcal{A}$

    $\langle 2 \rangle 5$. PICK $F \in \mathcal{A}$ maximal.

    $\langle 2 \rangle 6$. $\operatorname{dom} F = \operatorname{dom} R$

□

Theorem 133 (Well-Ordering Theorem (Choice)). *For any set A, there exists a well ordering on A.*

PROOF:

$\langle 1 \rangle 1$. LET: A be a set.

$\langle 1 \rangle 2$. PICK an ordinal α not dominated by A

$\langle 1 \rangle 3$. $A \preccurlyeq \alpha$

$\langle 1 \rangle 4$. PICK an injection $f : A \to \alpha$

$\langle 1 \rangle 5$. Define $<$ on A by: $x < y$ iff $f(x) \in f(y)$

$\langle 1 \rangle 6$. $<$ is a well ordering on A.

□

Corollary 133.1 (Numeration Theorem (Choice)). *Any set is equinumerous to some ordinal number.*

Theorem 134 (Transfinite Recursion). *Let $\mathbf{F} : \mathbf{V} \to \mathbf{V}$. Then there exists a function $\mathbf{G} : \mathbf{On} \to \mathbf{V}$ such that*

$$\forall \alpha \in \mathbf{On}.\mathbf{G}(\alpha) = \mathbf{F}(\mathbf{G} \restriction \alpha) \ .$$

PROOF: Define $\mathbf{G} = \{(\alpha, y) : \exists f : \alpha^+ \to \mathbf{V}.\forall \beta \in \alpha^+.f(\beta) = \mathbf{F}(f \restriction \beta)\}$. □

Definition 135 (Continuous). A function $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ is *continuous* iff $\mathbf{F}(\lambda) = \bigcup_{\beta \in \lambda} \mathbf{F}(\beta)$ for every limit ordinal λ.

Theorem 136. *Let $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ be continuous. Suppose $\forall \alpha \in \mathbf{On}.\mathbf{F}(\alpha) < \mathbf{F}(\alpha + 1)$. Then $\mathbf{F}$ is strictly monotone.*

PROOF:

$\langle 1 \rangle 1$. LET: $P(\beta)$ be the statement: $\forall \alpha < \beta.\mathbf{F}(\alpha) < \mathbf{F}(\beta)$

$\langle 1 \rangle 2$. $P(0)$

    PROOF: Vacuous.

$\langle 1 \rangle 3$. $\forall \beta \in \mathbf{On}.P(\beta) \Rightarrow P(\beta^+)$
   PROOF: For $\alpha < \beta^+$ we have $\mathbf{F}(\alpha) \leq \mathbf{F}(\beta) < \mathbf{F}(\beta^+)$.
$\langle 1 \rangle 4$. For every limit ordinal λ, if $\forall \beta < \lambda.P(\beta)$ then $P(\lambda)$
   PROOF: For $\alpha < \lambda$ we have $\mathbf{F}(\alpha) < \mathbf{F}(\alpha^+) \leq \mathbf{F}(\lambda)$.
□

Definition 137 (Normal). A function $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ is *normal* iff it is strictly monotone and continuous.

Theorem 138. *Let* $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ *be normal. Let* $t_0 \leq \beta$. *Then there exists a greatest* γ *such that* $\mathbf{F}(\gamma) \leq \beta$.

PROOF:
$\langle 1 \rangle 1$. LET: $\gamma = \{\alpha \in \mathbf{On} : \mathbf{F}(\alpha) \leq \beta\}$
$\langle 1 \rangle 2$. γ is an ordinal.
   $\langle 2 \rangle 1$. γ is a set.
      PROOF: We have $\alpha \leq \mathbf{F}(\alpha)$ for all α, so $\gamma \subseteq \beta$.
   $\langle 2 \rangle 2$. γ is a transitive set.
      PROOF: If $\alpha < \alpha'$ and $\mathbf{F}(\alpha') \leq \beta$ then $\mathbf{F}(\alpha) < \beta$ by monotonicity.
$\langle 1 \rangle 3$. $\gamma \neq 0$
   PROOF: By hypothesis.
$\langle 1 \rangle 4$. CASE: γ is a successor ordinal.
   PROOF: Let $\gamma = \alpha^+$. Then α is greatest such that $\mathbf{F}(\alpha) \leq \beta$.
$\langle 1 \rangle 5$. CASE: γ is a limit ordinal.
   PROOF: This is impossible since then $\mathbf{F}(\gamma) = \bigcup_{\alpha \in \gamma} \mathbf{F}(\alpha) \leq \beta$ and so $\gamma \in \gamma$.
□

Theorem 139. *Let* $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ *be normal. Let* S *be a nonempty set of ordinals. Then* $\mathbf{F}(\sup S) = \sup \mathbf{F}(S)$.

PROOF:
$\langle 1 \rangle 1$. $\mathbf{F}(\sup S) \geq \sup \mathbf{F}(S)$
   PROOF: By monotonicity.
$\langle 1 \rangle 2$. $\mathbf{F}(\sup S) \leq \sup \mathbf{F}(S)$
   $\langle 2 \rangle 1$. CASE: $\sup S \in S$
      PROOF: Immediate.
   $\langle 2 \rangle 2$. CASE: $\sup S \notin S$
      $\langle 3 \rangle 1$. $\sup S$ is a limit ordinal.
      $\langle 3 \rangle 2$. $\mathbf{F}(\sup S) = \sup\{\mathbf{F}(\beta) : \beta < \sup S\}$
      $\langle 3 \rangle 3$. $\forall \beta < \sup S.\mathbf{F}(\beta) \leq \sup \mathbf{F}(S)$
□

Theorem 140 (Veblen Fixed-Point Theorem (1907)). *A normal operation on ordinals has arbitrarily large fixed points.*

   That is, let $\mathbf{F} : \mathbf{On} \to \mathbf{On}$ *be normal. For all* $\alpha \in \mathbf{On}$*, there exists* $\beta \geq \alpha$ *such that* $\mathbf{F}(\beta) = \beta$.

PROOF: Let $\beta = \sup_{n \in \omega} F^n(\alpha)$. Then $\alpha \leq \beta$ using monotonicity, and
$$F(\beta) = \sup_{n \in \omega} F^{n+1}(\alpha)$$
$$= \beta \qquad\qquad\qquad\qquad \square$$

Definition 141 (Addition)**.** The *sum* of two ordinal numbers is the ordinal number of their concatenation.

Theorem 142. *Addition is associative.*

PROOF: Easy. $\square$

Theorem 143.
$$\alpha + 0 = 0 + \alpha = \alpha$$

PROOF: Easy. $\square$

Theorem 144.
$$\alpha + \beta^+ = (\alpha + \beta)^+$$

PROOF: Easy. $\square$

Theorem 145. *For λ a limit ordinal, $\alpha + \lambda = \sup_{\beta < \lambda}(\alpha + \beta)$.*

PROOF: Easy. $\square$

Theorem 146. *For any ordinal α, the function that maps β to $\alpha + \beta$ is normal.*

PROOF: Easy. $\square$

Corollary 146.1.
$$\beta < \gamma \Leftrightarrow \alpha + \beta < \alpha + \gamma$$

Corollary 146.2. *If $\alpha + \beta = \alpha + \gamma$ then $\beta = \gamma$.*

Theorem 147. *If $\beta \leq \gamma$ then $\beta + \alpha \leq \gamma + \alpha$.*

PROOF: Transfinite induction on α. $\square$

Theorem 148 (Subtraction Theorem)**.** *If $\alpha \leq \beta$ then there exists a unique ordinal γ such that $\alpha + \gamma = \beta$.*

PROOF: Let γ be greatest such that $\alpha + \gamma \leq \beta$. $\square$

Definition 149 (Multiplication)**.** The *product* of two ordinal numbers α and β is the ordinal number of $\alpha \times \beta$ under the lexicographic ordering.

Theorem 150. *Multiplication is associative.*

PROOF: Easy. $\square$

Theorem 151.
$$\alpha(\beta + \gamma) = \alpha\beta + \alpha\gamma$$

PROOF: Easy. □

PROOF: Easy. □

Theorem 155. *For λ a limit ordinal, $\alpha\lambda = \sup_{\beta<\lambda}(\alpha\beta)$.*

PROOF: Easy. □

Theorem 156. *For any ordinal $\alpha > 0$, the function that maps β to $\alpha\beta$ is normal.*

PROOF: Easy. □

Corollary 156.1. *For $\alpha > 0$ we have*

$$\beta < \gamma \Leftrightarrow \alpha\beta < \alpha\gamma$$

Corollary 156.2. *For $\alpha > 0$, if $\alpha\beta = \alpha\gamma$ then $\beta = \gamma$.*

Theorem 157. *If $\beta \leq \gamma$ then $\beta\alpha \leq \gamma\alpha$.*

PROOF: Transfinite induction on α. □

Theorem 158 (Division Theorem)**.** *Let $\delta \neq 0$. For any α, there exist unique ordinals β, γ such that $\alpha = \delta\beta + \gamma$ and $\gamma < \delta$.*

PROOF: Let β be largest such that $\delta\beta \leq \alpha$, and let γ be as given by the Subtraction Theorem. □

PROOF: Let γ be greatest such that $\alpha + \gamma \leq \beta$. □

Definition 159 (Exponentiation)**.** Define α^β by transfinite recursion thus:

$$\alpha^0 = 1$$
$$\alpha^{\beta^+} = \alpha^\beta \alpha$$
$$\alpha^\lambda = \sup_{\beta<\lambda} \alpha^\beta$$

for λ a limit ordinal.

Theorem 160. *For $\alpha > 1$, the function that maps β to α^β is normal.*

PROOF: Easy. $\square$

Corollary 160.1. *For $\alpha > 1$ we have*

$$\beta < \gamma \Leftrightarrow \alpha^\beta < \alpha^\gamma$$

Corollary 160.2. *For $\alpha > 1$, if $\alpha^\beta = \alpha^\gamma$ then $\beta = \gamma$.*

Theorem 161. *If $\beta \leq \gamma$ then $\beta^\alpha \leq \gamma^\alpha$.*

PROOF: Transfinite induction on α. $\square$

Theorem 162 (Logarithm Theorem). *Let $\alpha \neq 0$ and $\beta > 1$. Then there exist unique ordinals γ, δ, ρ such that $\alpha = \beta^\gamma \delta + \rho$, $0 < \delta < \beta$ and $\rho < \beta^\gamma$.*

PROOF: Let γ be greatest such that $\beta^\gamma \leq \alpha$, and then apply the Division Theorem. $\square$

Theorem 163.
$$\alpha^{\beta+\gamma} = \alpha^\beta \alpha^\gamma$$

PROOF: Transfinite induction on γ. $\square$

Theorem 164.
$$\alpha^{\beta\gamma} = (\alpha^\beta)^\gamma$$

PROOF: Transfinite induction on γ. $\square$

18   Natural Numbers

Definition 165 (Inductive). A class $\mathbf{A}$ is *inductive* iff $\emptyset \in \mathbf{A}$ and $\forall a \in \mathbf{A}.a^+ \in \mathbf{A}$.

Axiom 166 (Infinity). *There exists an inductive set.*

Definition 167 (Natural Number). A *natural number* is a set that belongs to every inductive set.

We write ω for the class of all natural numbers.

Theorem 168. *The class ω is a set.*

PROOF: Pick an inductive set I (by the Axiom of Infinity), then apply a Subset Axiom to I. $\square$

Theorem 169. *The set ω is inductive, and is a subset of every inductive set.*

PROOF: Easy. $\square$

Corollary 169.1 (Proof by Induction). *Any inductive subclass of ω is equal to ω.*

Theorem 170. *Every natural number except 0 is the successor of some natural number.*

PROOF: Easy proof by induction. □

Definition 171 (Peano System)**.** A *Peano system* is a triple $\langle N, S, e \rangle$ consisting of a set N, a function $S : N \to N$ and an element $e \in N$ such that:

1. $e \notin \operatorname{ran} S$

2. S is one-to-one

3. Any subset $A \subseteq N$ that contains e and is closed under S equals N.

Theorem 172. *For any transitive set a, $\bigcup(a^+) = a$.*

PROOF:

$$
\begin{aligned}
\bigcup(a^+) &= \bigcup(a \cup \{a\}) \\
&= \bigcup a \cup \bigcup\{a\} \\
&= \bigcup a \cup a \\
&= a
\end{aligned}
$$

since $\bigcup a \subseteq a$. □

Theorem 173. *Every natural number is a transitive set.*

PROOF:
$\langle 1 \rangle 1.$ 0 is a transitive set.
    PROOF: Vacuous.
$\langle 1 \rangle 2.$ For any natural number n, if n is a transitive set then n^+ is a transitive set.
    $\langle 2 \rangle 1.$ LET: n be a natural number that is a transitive set.
    $\langle 2 \rangle 2.$ $\bigcup(n^+) \subseteq n^+$
        PROOF: Theorem 172.
□

Theorem 174. $\langle \omega, \sigma, 0 \rangle$ *is a Peano system, where* $0 = \emptyset$ *and* $\sigma = \{\langle n, n^+ \rangle : n \in \omega\}$.

PROOF:
$\langle 1 \rangle 1.$ $0 \notin \operatorname{ran} \sigma$
    PROOF: For any $n \in \omega$ we have $0 \neq n^+$ since $n \in n^+$ and $n \notin 0$.
$\langle 1 \rangle 2.$ σ is one-to-one.
    PROOF: If $m^+ = n^+$ then $m = \bigcup(m^+) = \bigcup(n^+) = n$ using Theorems 172 and 173.
$\langle 1 \rangle 3.$ Any subset $A \subseteq \omega$ that contains 0 and is closed under σ equals ω.
□

Theorem 175. *The set ω is a transitive set.*

PROOF:

$\langle 1\rangle 1$. For every natural number n we have $\forall m \in n.\ m$ is a natural number.

   $\langle 2\rangle 1$. $\forall m \in 0.\ m$ is a natural number.

     PROOF: Vacuous.

   $\langle 2\rangle 2$. If n is a natural number and $\forall m \in n.\ m$ is a natural number, then $\forall m \in n^+.\ m$ is a natural number.

     PROOF: Since if $m \in n^+$ we have either $m \in n$ or $m = n$, and m is a natural number in either case.

☐

Theorem 176 (Recursion Theorem on ω). *Let A be a set, $a \in A$ and $F : A \to A$. Then there exists a unique function $h : \omega \to A$ such that*

$$h(0) = a \ ,$$

and for every n in ω,
$$h(n^+) = F(h(n)) \ .$$

PROOF:

$\langle 1\rangle 1$. Let us call a function v *acceptable* iff $\operatorname{dom} v \subseteq \omega$, $\operatorname{ran} v \subseteq A$ and:

     1. If $0 \in \operatorname{dom} v$ then $v(0) = a$

     2. For all $n \in \omega$, if $n^+ \in \operatorname{dom} v$ then $n \in \operatorname{dom} v$ and $v(n^+) = F(v(n))$.

$\langle 1\rangle 2$. LET: $\mathcal{K}$ be the set of acceptable functions.

$\langle 1\rangle 3$. LET: $h = \bigcup \mathcal{K}$

$\langle 1\rangle 4$. h is a function.

   $\langle 2\rangle 1$. LET: $S = \{n \in \omega : \text{for at most one } y, (n, y) \in h\}$

   $\langle 2\rangle 2$. S is inductive.

     $\langle 3\rangle 1$. $0 \in S$

       $\langle 4\rangle 1$. LET: $\langle 0, y_1\rangle, \langle 0, y_2\rangle \in h$

       $\langle 4\rangle 2$. PICK acceptable v_1 and v_2 such that $v_1(0) = y_1$ and $v_2(0) = y_2$

       $\langle 4\rangle 3$. $y_1 = a$

       $\langle 4\rangle 4$. $y_2 = a$

       $\langle 4\rangle 5$. $y_1 = y_2$

     $\langle 3\rangle 2$. $\forall k \in S.k^+ \in S$

       $\langle 4\rangle 1$. LET: $k \in S$

       $\langle 4\rangle 2$. LET: $(k^+, y_1), (k^+, y_2) \in h$

       $\langle 4\rangle 3$. PICK acceptable v_1, v_2 such that $v_1(k^+) = y_1$ and $v_2(k^+) = y_2$

       $\langle 4\rangle 4$. $y_1 = F(v_1(k))$

       $\langle 4\rangle 5$. $f_2 = F(v_2(k))$

       $\langle 4\rangle 6$. $v_1(k) = v_2(k)$

         $\langle 5\rangle 1$. $(k, v_1(k)), (k, v_2(k)) \in h$

         $\langle 5\rangle 2$. Q.E.D.

           PROOF: By $\langle 4\rangle 1$

       $\langle 4\rangle 7$. $y_1 = y_2$

   $\langle 2\rangle 3$. $S = \omega$

$\langle 1\rangle 5$. h is acceptable.

29

$\langle 2 \rangle 1$. If $0 \in \operatorname{dom} h$ then $h(0) = a$

$\langle 3 \rangle 4$. ASSUME: $m^+ \neq n$
    PROVE: $h(m^+) \neq h(n)$
$\langle 3 \rangle 5$. CASE: $n = 0$
  PROOF: $h(m^+) = S(h(m)) \neq e = h(n)$
$\langle 3 \rangle 6$. CASE: $n = p^+$
  $\langle 4 \rangle 1$. $m \neq p$
  $\langle 4 \rangle 2$. $h(m) \neq h(p)$
  $\langle 4 \rangle 3$. $S(h(m)) \neq S(h(p))$
  $\langle 4 \rangle 4$. $h(m^+) \neq h(p^+)$
$\langle 1 \rangle 3$. For all $x \in N$, there exists $n \in \omega$ such that $h(n) = x$
  PROOF: An easy induction on x.

$\square$

Theorem 178. *There is no function f with domain ω such that $\cdots \in f(2) \in f(1) \in f(0)$.*

PROOF: If there were then there would be no $m \in \mathrm{ran}\, f$ such that $m \cap \mathrm{ran}\, f = \emptyset$, contradicting the Axiom of Regularity. $\square$

Theorem 179 (Choice). *Let R be a relation on A. Then R is well founded iff there does not exist any function $f : \omega \to A$ such that $f(n+1)Rf(n)$ for all $n \in \omega$.*

PROOF:
$\langle 1 \rangle 1$. If R is well founded then there does not exist any function $f : \omega \to A$ such that $f(n+1)Rf(n)$ for all $n \in \omega$.
  PROOF: If there is such a function f then $\mathrm{ran}\, f$ is a nonempty subset of A with no R-minimal element.
$\langle 1 \rangle 2$. If there does not exist any function $f : \omega \to A$ such that $f(n+1)Rf(n)$ for all $n \in \omega$ then R is well founded.
  $\langle 2 \rangle 1$. LET: $X \subseteq A$ be a nonempty subset of A with no R-minimal element.
      PROVE: There exists a function $f : \omega \to A$ such that $f(n+1) < f(n)$ for all $n \in \omega$
  $\langle 2 \rangle 2$. PICK $a_0 \in X$
  $\langle 2 \rangle 3$. $\forall x \in X . \exists y \in X . yRx$
  $\langle 2 \rangle 4$. PICK a function $g : X \to X$ such that $\forall x \in X . g(x)Rx$
    PROOF: By the Axiom of Choice.

$\langle 2 \rangle 5$. Define $f : \omega \to A$ recursively by:
$$f(0) = a_0$$
$$f(n^+) = g(f(n))$$
$\langle 2 \rangle 6$. $\forall n \in \omega . f(n^+) R f(n)$

$\square$

Alternative proof for Theorem 86   Define $f : \omega \to \mathcal{P}A^2$ by $f(0) = R$ and $f(n^+) = f(n) \circ R$. Define $R^t = \bigcup_{n \in \omega} f(n)$.

Theorem 180. *For any set A, there exists the smallest transitive set B such that $A \subseteq B$.*

PROOF: Define $f : \omega \to \mathbf{V}$ by
$$f(0) = A$$
$$f(n^+) = f(n) \cup \bigcup f(n)$$
Then $\bigcup_n f(n)$ is the smallest transitive set that includes A. $\square$

Definition 181 (Transitive Closure)**.** The *transitive closure* of a set A is the least transitive set that includes A.

19   Finite Sets

Definition 182 (Finite)**.** A set is *finite* iff it is equinumerous with a natural number. Otherwise it is infinite.

Theorem 183. *No natural number is equinumerous with a proper subset of itself.*

PROOF:
$\langle 1 \rangle 1$. Any injective function $f : 0 \to 0$ has range 0.
   PROOF: Since the only such function is $\emptyset$.
$\langle 1 \rangle 2$. For any natural number n, if every injective function $f : n \to n$ has range n, then every injective function $f : n^+ \to n^+$ has range n^+.
   $\langle 2 \rangle 1$. LET: $n \in \omega$
   $\langle 2 \rangle 2$. ASSUME: Every injective function $f : n \to n$ has range n.
   $\langle 2 \rangle 3$. LET: $f : n^+ \to n^+$ be injective.
   $\langle 2 \rangle 4$. Define $g : n \to n$ by
   $$g(k) = \begin{cases} f(k) & \text{if } f(k) \in n \\ f(n) & \text{if } f(k) = n \end{cases}$$
   PROOF: If $k \in n$ and $f(k) = n$ then $f(n) \in n$ since f is injective.
   $\langle 2 \rangle 5$. g is injective.
      $\langle 3 \rangle 1$. LET: $i, j \in n$
      $\langle 3 \rangle 2$. ASSUME: $g(i) = g(j)$
      $\langle 3 \rangle 3$. CASE: $f(i) \in n$, $f(j) \in n$
         PROOF: Then $f(i) = f(j)$ so $i = j$

$\langle 3 \rangle 4$. CASE: $f(i) \in n$, $f(j) \notin n$
   PROOF: Then $f(i) = f(n)$ which is impossible as f is injective.
$\langle 3 \rangle 5$. CASE: $f(i) \notin n$, $f(j) \in n$
   PROOF: Then $f(n) = f(j)$ which is impossible as f is injective.
$\langle 3 \rangle 6$. CASE: $f(i) \notin n$, $f(j) \notin n$
   PROOF: Then $f(i) = f(j) = n$ so $i = j$.
$\langle 2 \rangle 6$. $\operatorname{ran} g = n$
  PROOF: By $\langle 2 \rangle 2$.
$\langle 2 \rangle 7$. $\operatorname{ran} f = n^+$
   $\langle 3 \rangle 1$. $\forall k \in n.k \in \operatorname{ran} f$
     PROOF: Since $\operatorname{ran} g \subseteq \operatorname{ran} f$.
   $\langle 3 \rangle 2$. $n \in \operatorname{ran} f$
     $\langle 4 \rangle 1$. CASE: $f(n) \in n$
        $\langle 5 \rangle 1$. PICK k such that $g(k) = f(n)$
        $\langle 5 \rangle 2$. $f(k) = n$
     $\langle 4 \rangle 2$. CASE: $f(n) = n$
        PROOF: Then $n \in \operatorname{ran} f$.
$\square$

Corollary 183.1. *No finite set is equinumerous with a proper subset of itself.*

Corollary 183.2. *The set ω is infinite.*

PROOF: Since the function that maps n to $n + 1$ is a bijection between ω and the proper subset $\omega - \{0\}$. $\square$

Corollary 183.3. *Every finite set is equinumerous with a unique natural number.*

Lemma 184. *Let n be a natural number and $C \subseteq n$. Then there exists $m \underline{\in} n$ such that $C \approx m$.*

PROOF:
$\langle 1 \rangle 1$. For all $C \subseteq 0$, there exists $m \underline{\in} 0$ such that $C \approx m$.
  PROOF: In this case $C = \emptyset$ and so $C \approx 0$.
$\langle 1 \rangle 2$. Let $n \in \omega$. Assume that, for all $C \subseteq n$, there exists $m \underline{\in} n$ such that $C \approx m$.
    Let $C \subseteq n^+$. Then there exists $m \underline{\in} n^+$ such that $C \approx m$.
  $\langle 2 \rangle 1$. LET: $n \in \omega$
  $\langle 2 \rangle 2$. ASSUME: For all $C \subseteq n$, there exists $m \underline{\in} n$ such that $C \approx m$.
  $\langle 2 \rangle 3$. LET: $C \subseteq n^+$
  $\langle 2 \rangle 4$. CASE: $n \in C$
     $\langle 3 \rangle 1$. PICK $m \underline{\in} n$ such that $C - \{n\} \approx m$
     $\langle 3 \rangle 2$. $C \approx m^+$
  $\langle 2 \rangle 5$. CASE: $n \notin C$
     PROOF: Then $C \subseteq n$ so $C \approx m$ for some $m \underline{\in} n$.
$\square$

Corollary 184.1. *Any subset of a finite set is finite.*

20   Cardinal Numbers

Definition 185 (Cardinality (Choice)). For any set A, define the *cardinal number* of A, $|A|$, to be the least ordinal that is equinumerous with A.

Theorem 186. *For any sets A and B, $|A| = |B|$ if and only if $A \approx B$.*

PROOF: Easy. □

Theorem 187. *For any finite set A, $|A|$ is the natural number such that $A \approx |A|$.*

PROOF: Immediate from definitions. □

Definition 188. We write $\aleph_0$ for $|\omega$.

21   Cardinal Arithmetic

Definition 189 (Addition). Let κ and λ be any cardinal numbers. Then $\kappa + \lambda = |K \cup L|$, where K and L are any disjoint sets of cardinality κ and λ respectively.

To show this is well-defined, we must prove that, if $K_1 \approx K_2$, $L_1 \approx L_2$, and $K_1 \cap L_1 = K_2 \cap L_2 = \emptyset$, then $K_1 \cup L_1 \approx K_2 \cup L_2$.

PROOF: Easy.

Lemma 190. *For any cardinal number κ we have $\kappa + 0 = \kappa$.*

PROOF: Since for any set K we have $K \cup \emptyset = K$.

Lemma 191. *For any natural number n we have $n + \aleph_0 = \aleph_0$.*

PROOF: Easy. □

Lemma 192.
$$\aleph_0 + \aleph_0 = \aleph_0$$

PROOF: Define $f : (\omega \times \{0\}) \cup (\omega \times \{1\}) \to \omega$ by $f(n,0) = 2n$ and $f(n,1) = 2n+1$. Then f is a bijection. □

Theorem 193.
$$\kappa + \lambda = \lambda + \kappa$$

PROOF: Easy. □

Theorem 194.
$$\kappa + (\lambda + \mu) = (\kappa + \lambda) + \mu$$

PROOF: Easy. □

Definition 195 (Multiplication). Let κ and λ be any cardinal numbers. Then $\kappa\lambda = |K \times L|$, where K and L are any sets of cardinality κ and λ respectively.

It is easy to prove this well-defined.

Lemma 196. *For any cardinal number κ we have $\kappa 0 = 0$.*

PROOF: For any set K we have $K \times \emptyset = \emptyset$. $\square$

Lemma 197. *For any natural number n we have $n\aleph_0 = \aleph_0$.*

PROOF: Induction on n using Lemma 192. $\square$

Lemma 198.
$$\aleph_0\aleph_0 = \aleph_0$$

PROOF: Define $f : \omega \times \omega \to \omega$ by $f(m,n) = 2^m(2n+1) - 1$. Then f is a bijection. $\square$

Lemma 199.
$$\kappa 1 = \kappa$$

PROOF: Easy. $\square$

Theorem 200.
$$\kappa\lambda = \lambda\kappa$$

PROOF: Easy. $\square$

Theorem 201.
$$\kappa(\lambda\mu) = (\kappa\lambda)\mu$$

PROOF: Easy. $\square$

Theorem 202.
$$\kappa(\lambda + \mu) = \kappa\lambda + \kappa\mu$$

PROOF: Easy. $\square$

Definition 203 (Exponentiation)**.** Let κ and λ be any cardinal numbers. Then $\kappa^\lambda = |K^L|$, where K and L are any sets of cardinality κ and λ respectively.

It is easy to prove this well-defined.

Theorem 204. *For any cardinal κ, $\kappa^0 = 1$.*

PROOF: For any set K, there is only one function $\emptyset \to K$, namely $\emptyset$. $\square$

Theorem 205. *For any non-zero cardinal κ, we have $0^\kappa = 0$.*

PROOF: For any nonempty set K, there is no function $K \to \emptyset$. $\square$

Theorem 206. *For any set A, $|\mathcal{P}A| = 2^{|A|}$.*

PROOF: Define the bijection $f : \mathcal{P}A \to 2^A$ by $f(S)(a) = 1$ if $a \in S$, 0 if $a \notin S$. $\square$

Corollary 206.1. *For any cardinal κ, we have $\kappa \neq 2^\kappa$.*

Theorem 207.
$$\kappa^{\lambda+\mu} = \kappa^\lambda \kappa^\mu$$

PROOF: Easy. □

Theorem 208.
$$(\kappa\lambda)^\mu = \kappa^\mu \lambda^\mu$$

PROOF: Easy. □

Theorem 209.
$$(\kappa^\lambda)^\mu = \kappa^{\lambda\mu}$$

PROOF: Easy. □

Lemma 210. *The union of a set of cardinal numbers is a cardinal number.*

PROOF:
⟨1⟩1. LET: A be a set of cardinal numbers.
⟨1⟩2. LET: $\alpha \in \bigcup A$
⟨1⟩3. PICK $\kappa \in A$ such that $\alpha \in \kappa$
⟨1⟩4. $\alpha \prec \kappa$
⟨1⟩5. $\alpha \prec \bigcup A$
□

22 Alephs

Definition 211. Define the cardinal number $\aleph_\alpha$ for every ordinal α by transfinite recursion thus: $\aleph_\alpha$ is the least infinite cardinal different from $\aleph_\beta$ for every $\beta < \alpha$.

Theorem 212. *If $\alpha < \beta$ then $\aleph_\alpha < \aleph_\beta$.*

PROOF: By minimality of $\aleph_\alpha$. □

Theorem 213. *Every infinite cardinal is of the form $\aleph_\alpha$ for some α.*

PROOF:
⟨1⟩1. LET: κ be an infinite cardinal
⟨1⟩2. ASSUME: for every infinite cardinal $\lambda < \kappa$, there exists α such that $\lambda = \aleph_\alpha$
⟨1⟩3. LET: $\alpha = \{\beta : \aleph_\beta < \kappa\}$
⟨1⟩4. α is a set.
    PROOF: The mapping $\beta \mapsto \aleph_\beta$ is an injection $\alpha \to \kappa$.
⟨1⟩5. α is a transitive set.
⟨1⟩6. α is an ordinal.
⟨1⟩7. $\aleph_\alpha$ is the least infinite cardinal different from $\aleph_\beta$ for all β such that $\aleph_\beta < \kappa$.
⟨1⟩8. $\aleph_\alpha$ is the least infinite cardinal different from λ for every infinite cardinal
    $\lambda < \kappa$.
    PROOF: By ⟨1⟩2.
⟨1⟩9. $\aleph_\alpha = \kappa$
□

23 Arithmetic

Lemma 214. *For any natural numbers m and n, we have $m + n^+ = (m + n)^+$.*

PROOF: Easy. □

Corollary 214.1. *The union of two finite sets is finite.*

Lemma 215. *For any natural numbers m and n we have $mn^+ = mn + m$.*

PROOF: Easy. □

Corollary 215.1. *The Cartesian product of two finite sets is finite.*

Lemma 216. *For any natural numbers m and n we have $m^{n^+} = m^n m$.*

PROOF: Easy. □

Corollary 216.1. *If A and B are finite sets then A^B is finite.*

24 Ordering on the Natural Numbers

Lemma 217. *For any natural numbers m and n, $m \in n$ if and only if $m^+ \in n^+$.*

PROOF:
$\langle 1 \rangle$1. $\forall m, n \in \omega (m \in n \Rightarrow m^+ \in n^+)$
   $\langle 2 \rangle$1. $\forall m \in \omega (m \in 0 \Rightarrow m^+ \in 0^+)$
     PROOF: Vacuous.
   $\langle 2 \rangle$2. For all $n \in \omega$, if $\forall m \in n.m^+ \in n^+$ then $\forall m \in n^+.m^+ \in n^{++}$
     $\langle 3 \rangle$1. LET: $n \in \omega$
     $\langle 3 \rangle$2. ASSUME: $\forall m \in n.m^+ \in n^+$
     $\langle 3 \rangle$3. LET: $m \in n^+$
     $\langle 3 \rangle$4. CASE: $m \in n$
       $\langle 4 \rangle$1. $m^+ \in n^+$
         PROOF: By $\langle 3 \rangle$2
       $\langle 4 \rangle$2. $m^+ \in n^{++}$
     $\langle 3 \rangle$5. CASE: $m = n$
       PROOF: $m^+ = n^+ \in n^{++}$
$\langle 1 \rangle$2. $\forall m, n \in \omega (m^+ \in n^+ \Rightarrow m \in n)$
   $\langle 2 \rangle$1. LET: $m, n \in \omega$
   $\langle 2 \rangle$2. ASSUME: $m^+ \in n^+$
   $\langle 2 \rangle$3. $m \in m^+$
   $\langle 2 \rangle$4. $m^+ \in n$ or $m^+ = n$
   $\langle 2 \rangle$5. $m \in n$
     PROOF: If $m^+ \in n$ this follows because n is transitive (Theorem 173).
□

Lemma 218. *For any natural number n we have $n \notin n$.*

PROOF:

$\langle 1 \rangle 1.\ 0 \notin 0$

$\langle 1 \rangle 2.$ For all $n \in \omega$, if $n \notin n$ then $n^+ \notin n^+$

  $\langle 2 \rangle 1.$ LET: $n \in \omega$

  $\langle 2 \rangle 2.$ ASSUME: $n^+ \in n^+$

      PROVE: $n \in n$

  $\langle 2 \rangle 3.$ $n^+ \in n$ or $n^+ = n$

  $\langle 2 \rangle 4.$ $n \in n^+$

  $\langle 2 \rangle 5.$ $n \in n$

    PROOF: If $n^+ \in n$ this follows because n is transitive (Theorem 173).

$\Box$

Theorem 219 (Trichotomy Law for ω). *For any natural numbers m and n, exactly one of*

$$m \in n, m = n, n \in m$$

holds.

PROOF:

$\langle 1 \rangle 1.$ For any $m, n \in \omega$, at most one of $m \in n$, $m = n$, $n \in m$ holds.

  PROOF: If $m \in n$ and $m = n$ then $m \in m$ contradicting Lemma 218.

  If $m \in n$ and $n \in m$ then $m \in m$ by Theorem 173, contradicting Lemma 218.

$\langle 1 \rangle 2.$ For any $m, n \in \omega$, at least one of $m \in n$, $m = n$, $n \in m$ holds.

  $\langle 2 \rangle 1.$ For all $n \in \omega$, either $0 \in n$ or $0 = n$

    $\langle 3 \rangle 1.$ $0 = 0$

    $\langle 3 \rangle 2.$ For all $n \in \omega$, if $0 \in n$ or $0 = n$ then $0 \in n^+$

  $\langle 2 \rangle 2.$ For all $m \in \omega$, if $\forall n \in \omega (m \in n \lor m = n \lor n \in m)$ then $\forall n \in \omega (m^+ \in n \lor m^+ = n \lor n \in m^+)$

    $\langle 3 \rangle 1.$ LET: $m \in \omega$

Theorem 242. $0 \neq 1$

PROOF: Easy. □

Lemma 243. *If $(m, n) \sim (m', n')$ and $(p, q) \sim (p', q')$ then $m + q \in p + n$ iff $m' + q' \in p' + n'$.*

PROOF:
$$m + q \in p + n \Leftrightarrow m + q + n' + q' \in p + n + n' + q'$$
$$\Leftrightarrow m' + n + q + q' \in p' + n + n' + q$$
$$\Leftrightarrow m' + q' \in p' + n' \qquad \square$$

Definition 244 (Ordering). The ordering $<$ on $\mathbb{Z}$ is defined by: $[(m, n)] < [(p, q)]$ iff $m + q \in n + p$.

Theorem 245. *The relation $<$ is a linear ordering on $\mathbb{Z}$.*

PROOF:
⟨1⟩1. $<$ is transitive.
　⟨2⟩1. ASSUME: $[(m, n)] < [(p, q)]$ and $[(p, q)] < [(r, s)]$
　⟨2⟩2. $m + q \in n + p$ and $p + s \in q + r$
　⟨2⟩3. $m + q + s \in n + p + s$
　⟨2⟩4. $n + p + s \in n + q + r$
　⟨2⟩5. $m + q + s \in n + q + r$
　⟨2⟩6. $m + s \in n + r$
⟨1⟩2. $<$ satisfies trichotomy.
　PROOF: From trichotomy on ω.
$\square$

Theorem 246. *For any integers a, b and c, we have $a < b$ iff $a + c < b + c$.*

PROOF: An easy consequence of the corresponding property in ω.

Corollary 246.1. *If $a + c = b + c$ then $a = b$.*

Theorem 247. *If $0 < c$, then the function that maps an integer a to ac is strictly monotone.*

PROOF:
⟨1⟩1. LET: a, b and c be integers.
⟨1⟩2. ASSUME: $0 < c$ and $a < b$
⟨1⟩3. LET: $a = [(m, n)]$
⟨1⟩4. LET: $b = [(p, q)]$
⟨1⟩5. LET: $c = [(r, s)]$
⟨1⟩6. $s \in r$
⟨1⟩7. $m + q \in p + n$
⟨1⟩8. $(m + q)r + (p + n)s \in (m + q)s + (p + n)r$
　PROOF: Lemma 225.
⟨1⟩9. $ac < bc$
$\square$

Lemma 248. *For integers a and b, $a(-b) = -(ab)$*

PROOF: This follows from the fact that $ab + a(-b) = a(b + (-b)) = a0 = 0$. $\square$

Theorem 249. *For integers a, b and c, if $a < b$ and $c < 0$ then $ac > bc$.*

PROOF: We have $0 < -c$ so $a(-c) < b(-c)$ hence $-(ac) < -(bc)$ so $bc < ac$. □

Theorem 250. *For any integers a and b, if $ab = 0$ then $a = 0$ or $b = 0$.*

PROOF: We prove if $a \neq 0$ and $b \neq 0$ then $ab \neq 0$.
If $a > 0$ and $b > 0$ then $ab > 0$. Similarly for the other four cases. □

Theorem 251. *If $ac = bc$ and $c \neq 0$ then $a = b$.*

PROOF: We have $(a - b)c = 0$ so $a - b = 0$ hence $a = b$. □

Definition 252 (Positive). An integer a is *positive* iff $0 < a$.

Theorem 253. *Define $E : \omega \to \mathbb{Z}$ by $E(n) = [(n, 0)]$. Then E maps ω one-to-one into $\mathbb{Z}$, and:*

    1. $E(m + n) = E(m) + E(n)$

    2. $E(mn) = E(m)E(n)$

    3. $m \in n$ if and only if $E(m) < E(n)$.

PROOF: Routine calculations. □

26 Equinumerosity

Definition 254 (Equinumerous). Two sets A and B are *equinumerous*, $A \approx B$, iff there exists a bijection between them.

Theorem 255. *Equinumerosity is an equivalence relation on the class of sets.*

PROOF: Easy. □

Theorem 256 (Cantor 1873). *No set is equinumerous with its power set.*

PROOF:
$\langle 1 \rangle 1$. LET: $g : A \to \mathcal{P}A$
      PROVE: g is not surjective.
$\langle 1 \rangle 2$. LET: $B = \{x \in A : x \notin g(x)\}$
$\langle 1 \rangle 3$. $\forall x \in A.g(x) \neq B$
   PROOF: Because $x \in B$ iff $x \notin g(x)$.
□

27 Ordering Cardinal Numbers

Definition 257 (Dominated). A set A is *dominated* by a set B, $A \preccurlyeq B$, iff there exists an injection $f : A \to B$.

Lemma 258. *Domination is a preorder on the class of sets.*

PROOF: Easy. □

Lemma 259. *If $A \subseteq B$ then $A \preccurlyeq B$.*

PROOF: The inclusion from A to B is an injection. □

Lemma 260. *If $A \preccurlyeq B$, $A \approx A'$ and $B \approx B'$ then $A' \preccurlyeq B'$.*

PROOF: Easy. □

Definition 261. Given cardinal numbers κ and λ, we write $\kappa \leq \lambda$ iff $K \preccurlyeq L$, where K is any set of cardinality κ and L is any set of cardinality λ.
  We write $\kappa < \lambda$ iff $\kappa \leq \lambda$ and $\kappa \neq \lambda$.

Theorem 262 (Schröder-Bernstein)**.** *If $A \preccurlyeq B$ and $B \preccurlyeq A$ then $A \approx B$.*

PROOF:
$\langle 1 \rangle$1. LET: $f : A \to B$ and $g : B \to A$ be one-to-one.
$\langle 1 \rangle$2. Define the sequence of sets $C_n \subseteq A$ by:
$$C_0 = A - \operatorname{ran} g$$
$$C_{n+1} = g(f(C_n))$$
$\langle 1 \rangle$3. Define $h : A \to B$ by
$$h(x) = \begin{cases} f(x) & \text{if } \exists n \in \mathbb{N}. x \in C_n \\ g^{-1}(x) & \text{otherwise} \end{cases}$$
$\langle 1 \rangle$4. h is injective.
  $\langle 2 \rangle$1. LET: $x, y \in A$
  $\langle 2 \rangle$2. ASSUME: $h(x) = h(y)$
  $\langle 2 \rangle$3. CASE: $x \in C_m$, $y \in C_n$
    PROOF: We have $f(x) = f(y)$ so $x = y$
  $\langle 2 \rangle$4. CASE: $x \in C_m$, $y \notin \bigcup_n C_n$
    PROOF: This case is impossible because we would have $y = g(f(x))$ and so $y \in C_{m+1}$.
  $\langle 2 \rangle$5. CASE: $x, y \notin \bigcup_n C_n$
    PROOF: We have $g^{-1}(x) = g^{-1}(y)$ so $x = y$.
$\langle 1 \rangle$5. h is surjective.
  $\langle 2 \rangle$1. LET: $y \in B$
  $\langle 2 \rangle$2. ASSUME: $y \notin f(C_n)$ for all n
  $\langle 2 \rangle$3. $g(y) \notin C_n$ for all n
  $\langle 2 \rangle$4. $y = h(g(y))$
□

Corollary 262.1. *The relation $\leq$ is a partial order on the class of cardinal numbers.*

Theorem 263. *Let κ, λ and μ be cardinal numbers.*

  1. $\kappa \leq \lambda \Rightarrow \kappa + \mu \leq \lambda + \mu$

  2. $\kappa \leq \lambda \Rightarrow \kappa\mu \leq \lambda\mu$

3. $\kappa \leq \lambda \Rightarrow \kappa^\mu \leq \lambda^\mu$

4. $\kappa \leq \lambda \Rightarrow \mu^\kappa \leq \mu^\lambda$ if κ and μ are not both zero.

PROOF: Parts 1–3 are easy. For part 4:
Let $|K| = \kappa$, $|L| = \lambda$ and $|M| = \mu$ with $K \subseteq L$.
If $M = \emptyset$ then $\kappa \neq 0$ so $\mu^\kappa = 0 \leq \mu^\lambda$.
Otherwise, pick $a \in M$. Define $\Phi : M^K \to M^L$ by:
$$\Phi(f)(x) = \begin{cases} f(x) & \text{if } x \in K \\ a & \text{if } x \notin K \end{cases}$$

Then Φ is an injection. □

Theorem 264 (Cardinal Comparability). *The Axiom of Choice is equivalent to the statement: for any sets C and D, either $C \preccurlyeq D$ or $D \preccurlyeq C$.*

PROOF:
⟨1⟩1. If Zorn's Lemma then Cardinal Comparability.
  ⟨2⟩1. ASSUME: Zorn's Lemma
  ⟨2⟩2. LET: C and D be sets.
  ⟨2⟩3. LET: $\mathcal{A}$ be the set of all injective functions f with $\text{dom} f \subseteq C$ and $\text{ran} f \subseteq D$
  ⟨2⟩4. For every chain $\mathcal{B} \subseteq \mathcal{A}$ we have $\bigcup \mathcal{B} \in \mathcal{A}$
  ⟨2⟩5. LET: $f \in \mathcal{A}$ be maximal
  ⟨2⟩6. $\text{dom} f = C$ or $\text{ran} f = D$
  ⟨2⟩7. f is an injective function $C \to D$ or f^{-1} is an injective function $D \to C$
⟨1⟩2. If Cardinal Comparability then the Well-Ordering Theorem.
  ⟨2⟩1. ASSUME: Cardinal Comparability
  ⟨2⟩2. LET: A be any set
  ⟨2⟩3. PICK an ordinal α not dominated by A
    PROOF: Hartogs' Theorem.
  ⟨2⟩4. $A \preccurlyeq \alpha$
  ⟨2⟩5. PICK an injective function $f : A \to \alpha$
  ⟨2⟩6. Define $<$ on A by: $x < y$ iff $f(x) \in f(y)$
  ⟨2⟩7. $<$ is a well ordering on A.
□

Theorem 265 (Choice). *For any infinite set A, we have $\omega \preccurlyeq A$.*

PROOF:
⟨1⟩1. LET: A be an infinite set.
⟨1⟩2. PICK a choice function F for A
⟨1⟩3. Define $f : \omega \to A$ by recursion by: $f(n) = F(A - \{f(0), f(1), \ldots, f(n-1)\})$
  PROOF: $A - \{f(0), f(1), \ldots, f(n-1)\}$ is nonempty because A is infinite.
⟨1⟩4. f is injective.
□

Corollary 265.1 (Choice). *For any infinite cardinal κ we have $\aleph_0 \leq \kappa$.*

Corollary 265.2 (Choice)**.** *A set is infinite iff it is equinumerous to a proper subset of itself.*

Proposition 266 (Choice)**.** *If there exists a surjection $A \to B$ then $B \preccurlyeq A$.*

PROOF: Any surjection $A \to B$ has a right inverse which is an injection $B \to A$.

28 Countable Sets

Definition 267 (Countable)**.** A set is *countable* iff it is dominated by ω.

Proposition 268. *Any subset of a countable set is countable.*

PROOF: Easy. □

The union of two countable sets is countable.

PROOF: Because $\aleph_0 + \aleph_0 = \aleph_0$ □

Proposition 269. *The product of two countable sets is countable.*

PROOF: Because $\aleph_0 \aleph_0 = \aleph_0$. □

Proposition 270 (Choice)**.** *For any infinite set A, the set $\mathcal{P}A$ is uncountable.*

PROOF: If $|A| \geq \aleph_0$ then $|\mathcal{P}A| \geq 2^{\aleph_0}$. □

Theorem 271 (Choice)**.** *A countable union of countable sets is countable.*

PROOF:
$\langle 1 \rangle 1$. LET: $\mathcal{A}$ be a countable set of countable sets.
$\langle 1 \rangle 2$. ASSUME: w.l.o.g. $\mathcal{A} \neq \emptyset$ and $\emptyset \notin \mathcal{A}$
$\langle 1 \rangle 3$. PICK a surjection $G : \omega \to \mathcal{A}$
$\langle 1 \rangle 4$. PICK a function F with domain ω such that, for all m, $F(m)$ is a surjection $\omega \to G(m)$
 PROOF: By the Axiom of Choice.
$\langle 1 \rangle 5$. Define $f : \omega \times \omega \to \bigcup \mathcal{A}$ by $f(m, n) = F(m)(n)$
$\langle 1 \rangle 6$. f is surjective.
$\langle 1 \rangle 7$. $\mathcal{A} \preccurlyeq \omega \times \omega$
□

29 Arithmetic of Infinite Cardinals

Lemma 272 (Choice)**.** *For any infinite cardinal κ we have $\kappa \cdot \kappa = \kappa$.*

PROOF:
$\langle 1 \rangle 1$. LET: κ be an infinite cardinal.
$\langle 1 \rangle 2$. LET: B be a set of cardinality κ.
$\langle 1 \rangle 3$. LET: $\mathcal{H} = \{f : f = \emptyset$ or for some infinite $A \subseteq B, f$ is a bijection between $A \times A$ and $A\}$
$\langle 1 \rangle 4$. For any chain $\mathcal{C} \subseteq \mathcal{H}$, we have $\bigcup \mathcal{C} \in \mathcal{H}$

$\langle 2 \rangle$1. LET: $\mathcal{C} \subseteq \mathcal{H}$ be a chain.

$\langle 2 \rangle$2. ASSUME: w.l.o.g. $\mathcal{C}$ has a nonempty element.

   PROOF: Otherwise $\bigcup \mathcal{C} = \emptyset \in \mathcal{H}$.

$\langle 2 \rangle$3. $\bigcup \mathcal{C}$ is an injective function.

$\langle 2 \rangle$4. LET: $A = \operatorname{ran} \bigcup \mathcal{C}$

$\langle 2 \rangle$5. A is infinite.

$\langle 2 \rangle$6. $\bigcup \mathcal{C}$ is a bijection between $A \times A$ and A.

   $\langle 3 \rangle$1. LET: $a_1, a_2 \in A$

   $\langle 3 \rangle$2. PICK $f_1, f_2 \in \mathcal{C}$ such that $a_1 \in \operatorname{ran} f_1$ and $a_2 \in \operatorname{ran} f_2$

   $\langle 3 \rangle$3. ASSUME: w.l.o.g. $f_1 \subseteq f_2$

   $\langle 3 \rangle$4. $\langle a_1, a_2 \rangle \in \operatorname{dom} f_2$

   $\langle 3 \rangle$5. $\langle a_1, a_2 \rangle \in \operatorname{dom} \bigcup \mathcal{C}$

$\langle 1 \rangle$5. PICK a maximal $f_0 \in \mathcal{H}$

  PROOF: Zorn's Lemma.

$\langle 1 \rangle$6. $f_0 \neq \emptyset$

  PROOF: B has a countable subset A, say, and $A \times A \approx A$.

$\langle 1 \rangle$7. PICK $A_0 \subseteq B$ infinite such that f_0 is a bijection between $A_0 \times A_0$ and A_0.

$\langle 1 \rangle$8. LET: $\lambda = |A_0|$

$\langle 1 \rangle$9. λ is infinite

$\langle 1 \rangle$10. $\lambda = \lambda \cdot \lambda$

$\langle 1 \rangle$11. $\lambda = \kappa$

  $\langle 2 \rangle$1. $|B - A_0| < \lambda$

   $\langle 3 \rangle$1. ASSUME: for a contradiction $\lambda \leq |B - A_0|$

   $\langle 3 \rangle$2. PICK $D \subseteq B - A_0$ with $|D| = \lambda$

   $\langle 3 \rangle$3. $(A_0 \cup D) \times (A_0 \cup D) = (A_0 \times A_0) \cup (A_0 \times D) \cup (D \times A_0) \cup (D \times D)$

   $\langle 3 \rangle$4. $f_0 : A_0 \times A_0 \approx A_0$

   $\langle 3 \rangle$5. $|(A_0 \times D) \cup (D \times A_0) \cup (D \times D)| = \lambda$

     PROOF:

$$
\begin{aligned}
|(A_0 \times D) \cup (D \times A_0) \cup (D \times D)| &= \lambda \cdot \lambda + \lambda \cdot \lambda + \lambda \cdot \lambda \\
&= \lambda + \lambda + \lambda && (\langle 1 \rangle 10) \\
&= 3 \cdot \lambda \\
&\leq \lambda \cdot \lambda \\
&= \lambda && (\langle 1 \rangle 10)
\end{aligned}
$$

   $\langle 3 \rangle$6. PICK a bijection $g : (A_0 \times D) \cup (D \times A_0) \cup (D \times D) \approx D$

   $\langle 3 \rangle$7. $f_0 \cup g : (A_0 \cup D) \times (A_0 \cup D) \approx A_0 \cup D$

   $\langle 3 \rangle$8. Q.E.D.

     PROOF: This contradicts the maximality of f_0.

  $\langle 2 \rangle$2. $\lambda = \kappa$

PROOF:

$$\kappa = |B|$$
$$= |A_0| + |B - A_0|$$
$$\leq \lambda + \lambda$$
$$= 2 \cdot \lambda$$
$$\leq \lambda \cdot \lambda$$
$$= \lambda$$
$$\leq \kappa$$

□

Corollary 272.1 (Absorption Law of Cardinal Arithmetic (Choice)). *Let κ and λ be cardinal numbers, the larger of which is infinite and the smaller of which is nonzero. Then*

$$\kappa + \lambda = \kappa \cdot \lambda = \max(\kappa, \lambda) \ .$$

PROOF:
⟨1⟩1. ASSUME: w.l.o.g. $\kappa \leq \lambda$
⟨1⟩2. $\kappa + \lambda = \lambda$
  PROOF:

$$\lambda \leq \kappa + \lambda$$
$$\leq \lambda + \lambda$$
$$= 2 \cdot \lambda$$
$$\leq \lambda \cdot \lambda$$
$$= \lambda$$

⟨1⟩3. $\kappa \cdot \lambda = \lambda$
  PROOF:

$$\lambda = 1 \cdot \lambda$$
$$\leq \kappa \cdot \lambda$$
$$\leq \lambda \cdot \lambda$$
$$= \lambda$$

□

30 Rank

Definition 273. Define the set V_α for every ordinal α by transfinite recursion thus:

$$V_\alpha = \bigcup \{ \mathcal{P} V_\beta : \beta \in \alpha \} \ .$$

Lemma 274. *For any ordinal α, V_α is a transitive set.*

PROOF:
⟨1⟩1. LET: α be an ordinal.

$\langle 1 \rangle 2$. LET: $x \in y \in V_\alpha$
$\langle 1 \rangle 3$. PICK $\beta \in \alpha$ such that $y \in \mathcal{P}V_\beta$
$\langle 1 \rangle 4$. $x \in V_\beta$
$\langle 1 \rangle 5$. PICK $\gamma \in \beta$ such that $x \in \mathcal{P}V_\gamma$
$\langle 1 \rangle 6$. $\gamma \in \alpha$ and $x \in \mathcal{P}V_\gamma$
$\langle 1 \rangle 7$. $x \in V_\alpha$
$\square$

Theorem 275. *For ordinals $\beta \in \alpha$ we have $V_\beta \subseteq V_\alpha$.*

PROOF:
$$
\begin{aligned}
V_\beta &= \bigcup_{\gamma \in \beta} \mathcal{P}V_\gamma \\
&\subseteq \bigcup_{\gamma \in \alpha} \mathcal{P}V_\gamma \\
&= V_\alpha
\end{aligned}
$$
$\square$

Theorem 276.
$$
V_0 = \emptyset
$$

PROOF: Immediate from definitions. $\square$

Theorem 277. *For any ordinal α, $V_{\alpha^+} = \mathcal{P}V_\alpha$.*

PROOF:
$$
\begin{aligned}
V_{\alpha^+} &= \bigcup_{\beta \leq \alpha} \mathcal{P}V_\beta \\
&= \mathcal{P}V_\beta
\end{aligned}
$$
by Theorem 275. $\square$

Theorem 278. *For λ a limit ordinal, $V_\lambda = \bigcup_{\beta < \lambda} V_\beta$.*

PROOF:
$$
\begin{aligned}
V_\lambda &= \bigcup_{\beta < \lambda} \mathcal{P}V_\beta \\
&= \bigcup_{\beta < \lambda} V_{\beta^+} \\
&= \bigcup_{\beta < \lambda} V_\beta
\end{aligned}
$$
since $\beta < \lambda$ iff $\beta^+ < \lambda$. $\square$

Definition 279 (Grounded, Rank). A set A is *grounded* iff $\exists \alpha . A \subseteq V_\alpha$. The *rank* of a grounded set A, rank A, is then the least ordinal α such that $A \subseteq V_\alpha$.

Theorem 280. *If A is grounded and $a \in A$ then a is grounded and* rank $a <$ rank A.

PROOF: We have $a \in A \subseteq V_{\text{rank } A}$. So $a \in \mathcal{P}V_\alpha$ for some $\alpha < $ rank A, i.e. $a \subseteq V_\alpha$ for some $\alpha <$ rank A, as required.

Theorem 281. *If every member of A is grounded then A is grounded and*

$$\operatorname{rank} A = \sup_{a \in A}(\operatorname{rank} a)^+ \ .$$

PROOF:
$\langle 1 \rangle 1$. LET: $\alpha = \sup_{a \in A}(\operatorname{rank} a)^+$
$\langle 1 \rangle 2$. $A \subseteq V_\alpha$
   $\langle 2 \rangle 1$. LET: $a \in A$
   $\langle 2 \rangle 2$. $a \subseteq V_{\operatorname{rank} a}$
   $\langle 2 \rangle 3$. $a \in V_{(\operatorname{rank} a)^+}$
   $\langle 2 \rangle 4$. $a \in V_\alpha$
$\langle 1 \rangle 3$. If $A \subseteq V_\beta$ then $\alpha \le \beta$
   $\langle 2 \rangle 1$. ASSUME: $A \subseteq V_\beta$
   $\langle 2 \rangle 2$. $\forall a \in A.a \in V_\beta$
   $\langle 2 \rangle 3$. $\forall a \in A.\exists \gamma < \beta.a \subseteq V_\gamma$
   $\langle 2 \rangle 4$. $\forall a \in A.\exists \gamma < \beta.\operatorname{rank} a \le \gamma$
   $\langle 2 \rangle 5$. $\forall a \in A.\operatorname{rank} a < \beta$
   $\langle 2 \rangle 6$. $\forall a \in A.(\operatorname{rank} a)^+ \le \beta$
   $\langle 2 \rangle 7$. $\alpha \le \beta$
$\square$

Theorem 282. *Every set is grounded.*

PROOF:
$\langle 1 \rangle 1$. ASSUME: for a contradiction c is not grounded.
$\langle 1 \rangle 2$. LET: B be the transitive closure of $\{c\}$.
$\langle 1 \rangle 3$. LET: $A = \{x \in B : x \text{ is not grounded}\}$
$\langle 1 \rangle 4$. PICK $m \in A$ such that $m \cap A = \emptyset$
   PROOF: By the Axiom of Regularity.
$\langle 1 \rangle 5$. Every member of m is grounded.
   PROOF: Every member of m is in B by transitivity but not in A.
$\langle 1 \rangle 6$. m is grounded.
   PROOF: Theorem 281.
$\langle 1 \rangle 7$. Q.E.D.
   PROOF: This contradicts the fact that $m \in A$.
$\square$

Theorem 283. *Let A be any set and A^t its transitive closure. Let M^t be the transitive closure of the relation $\{\langle x, y \rangle : x \in y \in A^t\}$. Define $E : A^t \to \mathbf{V}$ by transfinite recursion thus:*

$$E(a) = \{E(x) : xM^t a\} \qquad (a \in A^t) \ .$$

Then $E(a) = \operatorname{rank} a$ for all $a \in A^t$, and $\operatorname{ran} E = \operatorname{rank} A$.

PROOF:
$\langle 1 \rangle 1$. M^t is well-founded
   PROOF: Theorem 87.

50

$\langle 1 \rangle 2.$ $\forall a \in A^t.\operatorname{rank} a = \{\operatorname{rank} x : xM^t a\}$

    $\langle 2 \rangle 1.$ $\forall x, a \in A^t.xM^t a \Rightarrow \operatorname{rank} x < \operatorname{rank} a$

        PROOF: Theorem 280.

    $\langle 2 \rangle 2.$ $\forall x \in A^t.\forall \alpha < \operatorname{rank} a.\exists xM^t a.\alpha = \operatorname{rank} x$

        $\langle 3 \rangle 1.$ LET: $a \in A^t$

        $\langle 3 \rangle 2.$ ASSUME: $\forall bM^t a.\forall \alpha < \operatorname{rank} b.\exists xM^t b.\alpha = \operatorname{rank} x$

        $\langle 3 \rangle 3.$ LET: $\alpha < \operatorname{rank} a$

        $\langle 3 \rangle 4.$ PICK $b \in a$ such that $\alpha \leq \operatorname{rank} b$

          PROOF: Theorem 281.

        $\langle 3 \rangle 5.$ CASE: $\alpha < \operatorname{rank} b$

          $\langle 4 \rangle 1.$ PICK $xM^t b$ such that $\alpha = \operatorname{rank} x$

            PROOF: By $\langle 3 \rangle 2$

          $\langle 4 \rangle 2.$ $xM^t a$

        $\langle 3 \rangle 6.$ CASE: $\alpha = \operatorname{rank} b$

          PROOF: We have $bM^t a$ and $\alpha = \operatorname{rank} b$ as required.

        $\langle 3 \rangle 7.$ Q.E.D.

          PROOF: This concludes the proof by transfinite induction over M^t ($\langle 1 \rangle 1$).

$\langle 1 \rangle 3.$ $\forall a \in A^t.E(a) = \operatorname{rank} a$

    PROOF: By transfinite induction on a.

$\langle 1 \rangle 4.$ $\operatorname{ran} E = \operatorname{rank} A$

    PROOF: From $\langle 1 \rangle 3$ substituting $\{A\}$ for A.

$\square$
